AGENDA FOR THE EDNAP MEETING

INNSBRUCK – 30 OCTOBER 2018

Expected duration: 09.00 - 17.00

Coffee: 11.00-11.30 – Lunch: 13.00-14.00 – Coffee: 15.45-16.00

Host: Walther Parson and Richard Scheithauer
Chairman: Niels Morling

Welcome	Richard Scheithauer
The first collaborative EDNAP exercise	Peter Schneider
A brief history of EDNAP - The first ten years	Peter Gill
Regards from previous EDNAP members	Niles Morling
Update on activities	
Methylated DNA and age exercise	David Ballard
Exercise no. 2 on mRNA typing with MPS	C. Haas/G. Duro
mtDNA quantification exercise - update	Arnoud Kal
Updates from other groups	
ENFSI	Sander Kneppers
EMPOP (DNA.BASES)	Walther Parson
STRidER (DNA.BASES)	Walther Parson
The DNASEQEX project	Walther Parson
The VISAGE project	Walther Parson
ISFG	Walther Parson
Other activities	
Update on Euroformix	Peter Gill
Massive on-line open course in interpretations of DNA results	Tacha Hicks/P. Gill
Future activities	
Collaborative exercise on detection of mtDNA heteroplasmy by MPS	Walther Parson
EDNAP meeting in the spring of 2019	Niels Morling
Any other business	Niels Morling

EUROPEAN DNA PROFILING GROUP (EDNAP) MEETING

Innsbruck, Austria

30 October 2018

Host: Walther Parson and Richard Scheithauer
Chairman: Niels Morling

A list of participants is attached.

Welcome
Richar Scheithauer welcomed members to Innsbruck.

Update on exercises

The first collaborative exercise Peter Schneider
Peter Schneider gave a short review of the first collaborative EDNAP exercise on investigations of DNA with restriction fragment analysis and single locus DNA probes for forensic genetic investigation (presentation attached).

A brief history of EDNAP - The first ten years Peter Gill
Peter Gill gave a review of the activities of EDNAP during the first 10 years (presentation attached).

Regards from previous EDNAP members Niels Morling
Niels Morling presented regards from previous EDNAP members and selected photos from the first years of EDNAP (presentation attached)

Second exercise on methylated DNA and age David Ballard
David Ballard presented an update of the results of the second collaborative EDNAP exercise on age estimation by means of measurements of methylation of selected DNA positions. A draft of a manuscript is expected to be circulated before the end of 2018 (presentation attached).

Exercise no. 2 on mRNA typing with NGS Cordula Haas/Guro Dörum
Cordula Haas presented the results of the second collaborative EDNAP exercise on discrimination between various tissues and body fluids with mRNA determined with MPS. Cordula Haas reported new preliminary results on coding region SNPs (cSNPs) detected on transcripts of RNA from various tissues. Guro Dörum presented preliminary results on evaluation of the mRNA results. A draft of a manuscript is expected to be circulated before the next EDNAP meeting in spring 2019 (presentation attached).

mtDNA quantification exercise Arnoud Kal
Arnoud Kal updated about the planned collaborative exercise concerning quantification of mtDNA. Arnoud Kal on 29 Oct 2018 circulated the attached email. Please contact Arnoud Kal if you want to participate. The plan is to send out the exercise within the next few weeks (presentation attached).

Updates from other groups

ENFSI Sander Kneppers

Sander Kneppers reported from the ENFSI DNA Working Group (presentation attached).

EMPOP (DNA.BASES) Walther Parson

Walther Parson gave a short update of the activities of EMPOP (presentation attached).

STRidER (DNA.BASES) Walther Parson

Walther Parson gave a short update on STRidER (presentation attached).

TThe DNASEQEX project Walther Parson

Walther Parson gave an update on the DNASEQEX project (presentation attached).

The VISAGE project Walther Parson

Walther Parson gave an update on the VISAGE project (presentation attached).

ISFG Walther Parson

Walther Parson gave an update of the activities of the ISFG (presentation attached).

Other activities

Update on Euroformix Peter Gill

Peter Gill gave an update on Euroformix (presentation attached).

Free on-line course in interpretations of DNA results Tacha Hicks/Peter Gill

Peter Gill presented on behalf of Tacha Hicks Champod, Formation continue UNIL-EPFL & Ecole des sciences criminelles, Lausanne, France a free on-line course of interpretation of forensic science data. The course is intended as an awareness course. The course will be announce soon. A trailer is found at https://www.youtube.com/watch?v=UNewyg5xV5Q (presentation attached).

Future activities

mtDNA quantification exercise Arnoud Kal

Arnoud Kal and colleagues will send out the samples etc. for the exercise within the next few weeks. Laboratories are expected to return the results before 15 January 2019. The plan is to present preliminary results at the EDNAP meeting in the spring of 2019.

Collaborative exercise on detection of mtDNA heteropasmy by MPS Walther Parson

Walther Parson suggested to perform a collaborative exercise on mtDNA heteroplasmy. The Innsbruck laboratory plans to send out DNA extracted from individuals with point and/or length heteroplasmy. Participants are kindly asked to inform Walther Parson before 30 November 2018 if they will be able to contribute with interesting samples for circulation. The participating laboratories are invited to contribute to this exercise by providing sequence data of these samples using their preferred mtDNA sequencing method(s). This includes conventional Sanger and Massive Parallel Sequencing technologies. Walther Parson plans to send the experimental plan and samples around 15 January 2019. The plan is to invite participants to submit results no later than 15 March 2019, so that the preliminary results can be presented at the EDNAP meeting in the spring of 2019 (presentation enclosed).

Next exercise on mRNA typing with NGS Cordula Haas

Cordula Haas will be considering to present a suggestion for a new exercise at the EDNAP meeting in the spring of 2019.

Next meetings Niels Morling

The next EDNAP meeting will take place in Madrid in association with the CODIS and ENFSI DNA Working Group – most likely on 7 May 2019.

Any other business Niels Morling

There was no other business.

Closing of the meeting Niels Morling

The meeting closed with sincere thanks to Walther Parson, Richard Scheithauer, and all colleagues, who helped organise the meeting.

The minutes and attachments are found at the EDNAP website:
http://www.isfg.org/EDNAP/Meetings:

- Agenda
- Group photo
- List of participants
- Presentations
  - Peter Schneider: The first collaborative EDNAP exercise
  - Peter Gill: A brief history of EDNAP - The first ten years
  - Niels Morling: Regards from previous EDNAP members
  - David Ballard: Report on methylated DNA and age determination
  - Cordula Haas: Report on the second collaborative exercise on mRNA NGS
  - Arnoud Kal: Information on the planned mtDNA quantification exercise
  - Sander Kneppers: Report from the ENFSI DNA Working Group
  - Walther Parson: EMPOP report (DNA.BASES)
  - Walther Parson: STRidER report (DNA.BASES)
  - Walther Parson: The DNASEQEX project
  - Walther parsons: The VISAGE project
  - Walther Parson: ISFG report
  - Peter Gill: Update on Euroformix
  - Tacha Hicks: Free on-line course in interpretations of DNA results
  - Walther Parson: Collaborative exercise on detection of mtDNA heteroplasmy by MPS.

4 January 1989

Dear Dave

With a further meeting now imminent on European standardisation in DNA profiling I thought it worth summarising where we left off at the Sunbury meeting. Points needing further consideration were listed as follows:

1. Flexible alternatives to DNA profiling. Traditional grouping should not be abandoned
2. Core package of probes
3. Standardisation of restriction enzyme
4. Standard molecular weight markers
5. Population data
6. Records for comparative purposes
7. QA and proficiency testing - QC of commercial products
8. Legal constraints
9. New technology
10. Reporting probabilities

Please let us know if you need any further input from the MPFSL. By copy of this letter I will remind those who attended the Sunbury meeting to let the study group have any comments they wish to make if they have not already done so. In return, although I realise time is passing, I hope that those attending the February meeting in Munster will receive copies of the report a day or two ahead of the meeting itself.

With best wishes

Yours sincerely

Brian

METROPOLITAN POLICE

FORENSIC SCIENCE LABORATORY

14 February 1989

Dear Colleague

I have enclosed a synopsis of the recent meeting in Munster and I am sure that you would wish to join me in thanking Prof. Brinkmann and Mr Rand for their work in providing the venue for the meeting and also making the social arrangements.

The synopsis includes the details of the research exercise to determine standard deviations of bands usng Hinf I and YNH 24.

There appears to have been general agreement that the meeting was a great success and on behalf of the CRSE and Metropolitan Police Laboratory we thank you sincerely for your co-operation in this attempt to bring the Europeans closer together.

Very best wishes

P.D. Martin

Peter D Martin
Deputy Director

DNA Profiling - European Integration
Munster - 4th February 1989

Chairman: Prof B Brinkmann

A list of participants is appended.

Synopsis of the proceedings

Prof Brinkmann opened the meeting by welcoming all of the participants to the second gathering of this group. He outlined a case which had been examined in Germany and involved the rape and murder of an English woman by an English man. The DNA grouping of the semen showed a frequency of 1 in 60 million, and the British Army SIB felt that the suspect may have been responsible for other such crimes in the UK. This illustrates the value of inter-European databases.

Bruce Budowle (FBI) is investigating small alleles for PCR and also discrete alleles because of the problem of formulating band-sharing statistics. If this is successful and PCR is the choice for the future the subject of the use of enzymes would disappear.

There are difficulties with PCR/Dot blotting at present especially as dilution will increase the danger of losing alleles.

Small alleles are amplified preferentially over the larger ones. Contamination is still the biggest problem.

In the discussion which followed members were reminded that Cetus hold the patent for PCR and that each laboratory would have to be licensed separately.

A limited amount of research on PCR has been carried out at CRSE. It was thought that the use of PCR for routine casework is still some way into the future.

The conditions of the exercise were then presented to the meeting.

Each of the 12 labs will prepare enough DNA for a least 50µg to be sent to each of the participants.
The DNA should be in TE buffer and the concentration stated.
Samples should be distributed by 15 March 1989.
Werrett will supply each lab with YNH24 and ask Amersham to distribute ^{35}S markers by 15 March 1989.
Each lab should check their DNA preparation for high m.wt concentration.
The source and batch number of Hinf I should be stated.

The length of the gel should be stated and should be greater than 20 cm.
Each sample should be run ten times.
The concentration and volume added to each track should be stated.
Measurements of bands (as per Schneider) should be made, and those together with autoradiographs (or good copies) sent to Prof Rittner and Dr Werrett.
Results should be despatched by 31 July 1989.
(If a laboratory has not completed the whole exercise, whatever results are available should be sent by 31 July 1989.)

Mr Kloosterman and Mr Lochtenberg agreed to host the next meeting in The Hague on 6 October 1989.

Prof Brinkmann thanked all present and after a concensus wished the participants to be known as the European DNA Profiling Group, he closed the meeting.

MINUTES OF THE GENERAL ASSEMBLY OF THE INTERNATIONAL SOCIETY FOR FORENSIC HAEMOGENETICS (ISFH) ON SEPTEMBER 20, 1991 IN THE KURFÜRSTLICHE SCHLOSS ZU MAINZ (17.00 - 18.20)

TOP 4 Report of the Executive Committee and the Auditors of the Account

4.1. Report of the President
B. Brinkmann reported that the Executive Committee had handled its business since the last congress in only 4 sessions.
He presented the wish of the EDNAP (European DNA Profiling Association) to become a Working Party of the ISFH. This request was accepted unanimously.

isfh
14TH CONGRESS
INTERNATIONAL SOCIETY
FOR FORENSIC HAEMOGENETICS
September 18 - 21, 1991

A brief history of EDNAP
The first ten years

Peter Gill

The first collaboration

- First meeting in Sunbury, UK in 1988.
- From the beginning the focus was on single locus probe rather than multi-locus probes, because the latter were to complex to interpret and there were limitations to reproducibility and scoring data for comparison purposes
- Single locus probes were discovered in 1982 by Ray White, some years before the Jeffreys probes were launched.
- The procedure was slow and tedious and involved using dangerous amounts of radioactivity, along with copious amounts of carcinogens like ethidium bromide

1989, Holland

- Topics included the thorny subject of biostatistics
- SLPs were ‘continuous’ which means that there were hundreds of overlapping alleles present in a population.
- We identified SLPs relative to their size measured next to ladder markers – much like today except the standard use was from a viral DNA marker
- Much discussion about how to apply frequency estimates to alleles and essentially there were two alternative methods termed the ‘binning method’ vs the ‘floating binning’ method

Questions addressed

Dr Werrett followed his presentation by posing 4 pertinent questions which should be discussed at the next meeting.

1. Is it possible to compare the results from one laboratory with those from another?

2. Is it possible to combine data-bases from various laboratories for population frequencies?

3. Should laboratories be accredited for their competence to perform DNA profiling?

4. What are the parameters necessary for the interpretation of autoradiographs?

Purpose and adoption of core probes as European standards

The aim of this group was restated:

"European integration using common technology with reference to stain grouping."

Finally it was agreed that MS43A should be the second probe adopted by EDNAP for all participating laboratories. This means that we now have a consensus to use Hinf 1 as the restriction enzyme and YNH 24 and MS43A as our core probes and the Amersham ^{35}S control markers.

1990 Bramshill, UK

- 4x SLPs had been introduced into casework in the UK
- MLPs gradually phased out of use
- Standardisation exercise:

It was unanimously agreed that we should all participate in an exercise whereby all laboratories used a standard method. The following points were considered:-

1.	Ladder markers	-	'Cold' Amersham ladder to be used.
2.	Ground control	-	Kloosterman will supply this from his immortal cell-lines.
3.	Agarose	-	CRSE will provide
4.	Buffer	-	Details will be supplied by CRSE.
5.	Ethidium bromide	-	This will only be used in the λ Hind III track.
6.	Samples	-	CRSE will supply 3 pre-extracted DNA samples and the same samples already restricted.

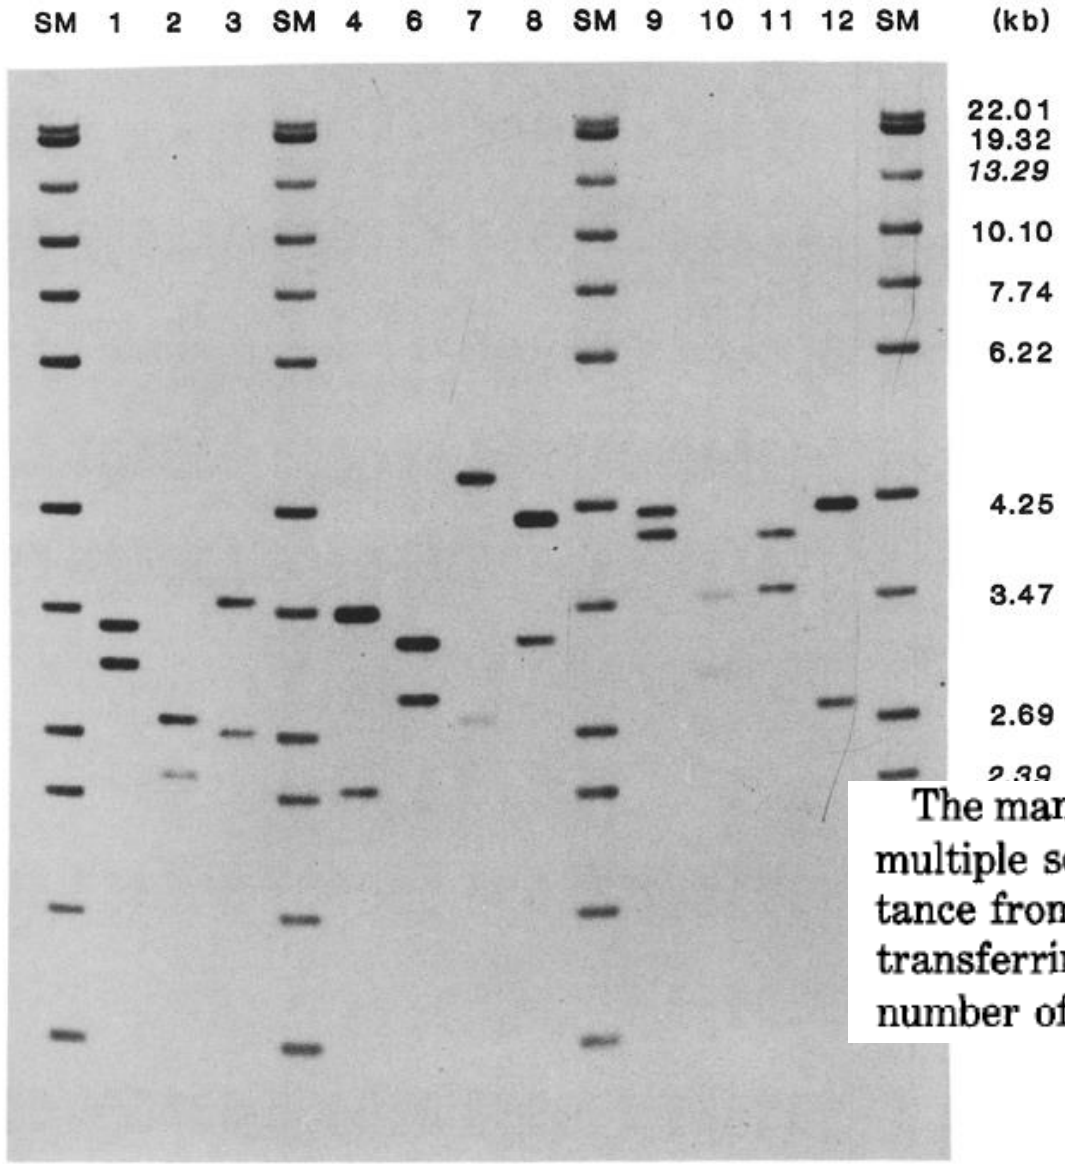

Fig. 2. Example for EDNAP exercise blot from laboratory 11 hybridized with ^{32}P-labelled YNH24. All 11 DNA samples of the exercise are included, the respective sample numbers are indicated above. The sizes of the ^{35}S-labelled marker fragments (SM) are given on the right side with the reference points for gel run length and RBP method printed in italics.

The manual reading of fragment positions using a ruler was problematic, since multiple sources of error were observed: (1) reading the correct migration distance from the ruler, (2) writing these measurements on a coding sheet and (3) transferring the data from the coding sheet to the computerized database. A number of these errors were only detected, when the printed data (see Figs. 3

The second collaborative exercise

(Received July 15th, 1991)
(Revision received September 10th, 1991)
(Accepted December 20th, 1991)

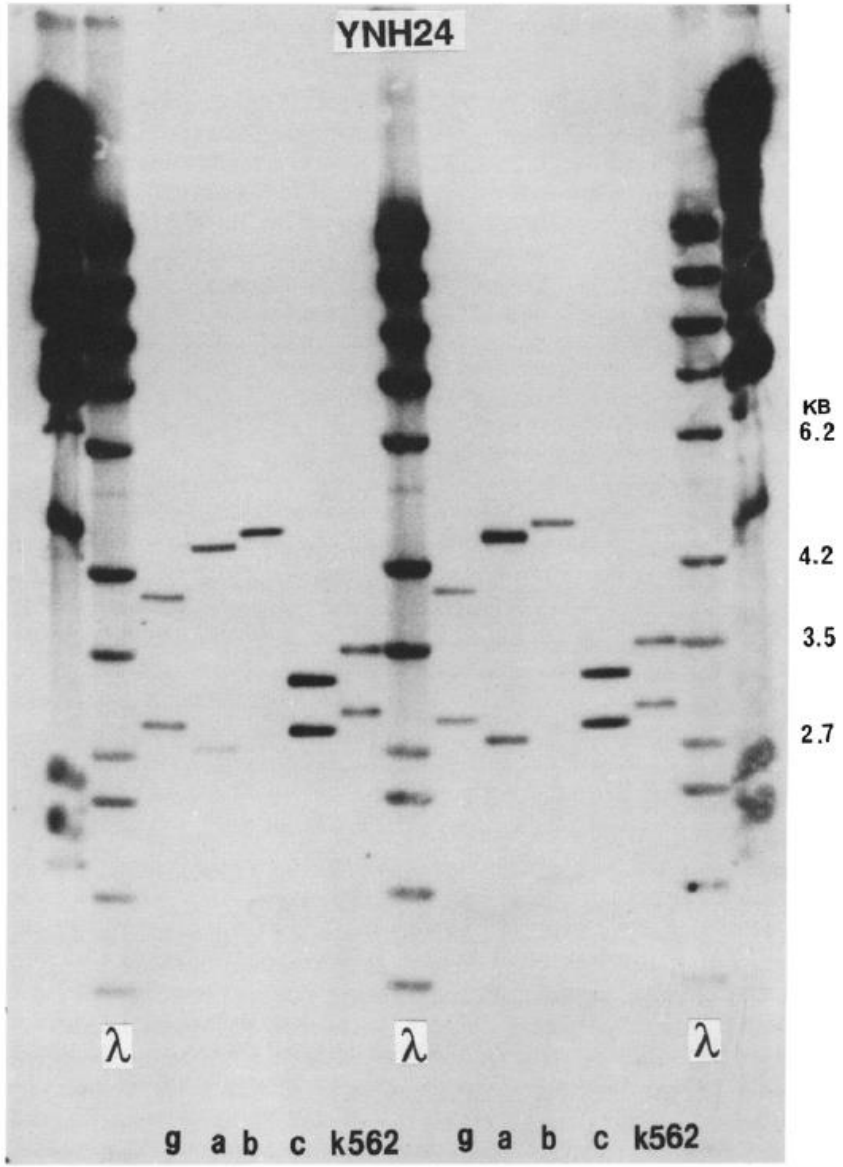

Fig. 1. Photograph of an autoradiograph showing the experimental design. The left hand side of the autoradiograph consisted of samples restricted by CRSE whereas the right hand side consisted of samples restricted by the participating laboratory. λ, ladder marker; g, genomic control (not used in this exercise); a, sample a; b, sample b; c, sample c; k, K562.

On a European level the following appear to be important:-

(a) Common enzyme
(b) Common probes
(c) Marker ladder
(d) Genomic control
(e) Electrophoretic system

The method of calculating the allelic (fragment) size is also important.

A uniform system has advantages:-

(a) Band sizes, determined in different labs, are directly comparable.
(b) The same statistical methodology can be used for interpretation.

suspect/victim. For this determination to be made each laboratory must have:-

(a) reproducible day-to-day methodology
(b) population frequency distributions
(c) genomic control which falls within a 'window'

For YNH 24

achieved > 99% agreement at a 2.8% match criterion
achieved 100% agreement at a 3.6% match criterion

Quality control and standards (discussed at the Rome meeting 1991

CRSE would provide a Quality Assurance programme which could either be used as proficiency test or as part of a Quality Management system.

For the first exercises laboratories would be given the results with no comments on performance.

In the discussion which followed Steve Rand suggested that some laboratories might join the scheme solely to avoid adverse criticism. He said that he could see many problems with the QA programme.

He felt that there were issues to be addressed beyond the integration process and that we should select objectives which are compatible with the EDNAP aims. Initially the group could become a European repository for population data and this would have the immediate advantages of

(a) an extended array of frequencies
(b) a deeper insight into population genetics

There was a unanimous decision at the meeting in Rome on 19 April, to make an application to the International Society for Forensic Haematologics to become a working group called EDNAP.

Aims: To meet the original aims of EDNAP

(a) To determine accurately alleles using single locus probing
(b) To facilitate the exchange of data between countries.
(c) The group will only study DNA extracted from stained material.

Further aims:

(i) Set and maintain standards within DNA profiling for European laboratories engaged in stain work.

(ii) To provide a forum for the exchange of population frequency databases and collaboration in research.

Oslo 1992 – towards STRs

- EDNAP became a working group of the ISFH

4. Short Tandem Repeats (STRs) **M.Greenhalgh, MPFSL**

PCR is still in the research stage at the MPFSL but, having identified several problems associated with PCR-based VNTRs, a programme of collaborative work with CRSE has been agreed to progress work on STRs.
There are several reasons for choosing STRs in preference to other PCR-based VNTRs, among them being:-

resistance to degradation
ease of multiplexing
general robustness
short repeats - less chance of deletions

MPFSL and CRSE have agreed to concentrate on SE33 and HumTHO 1 in the initial stages.

There was some considerable discussion on the ethical problems on the use of polymorphisms from non-coding regions which have some linkage association with disease problems related to coding parts of the genome. It was decided that we should keep a watching brief on this situation and return to the subject at our next meeting.

The following examples were used to illustrate the choice available:-

name	core repeat	No of alleles
HumTHO 1	(TCAT)n	7
SE33	(AAAG)n AA(AAAG)n	21

The third collaborative exercise

6. Further collaborative exercises

Peter Gill proposed that the next collaborative exercise should be based on STRs and that the group should have STRs as the linking systems for future casework.
In the first instance HumTHO 1 and SE33 should be used and form the basis of the collaborative exercise. This is without prejudice as other STRs may be identified at a later date which have better characteristics for casework.

This was accepted unanimously.

CRSE will prepare the trial and Peter Schneider offered to make the primers. Details will be sent to members of the group.

Report of the European DNA profiling group (EDNAP) — towards standardisation of short tandem repeat (STR) loci

P. Gill*[a], C. Kimpton[a], E. D'Aloja[b], J.F. Andersen[c], W. Bar[d], B. Brinkmann[e], S. Holgersson[f], V. Johnsson[g], A.D. Kloosterman[h], M.V. Lareu[i], L. Nellemann[j], H. Pfitzinger[k], C.P. Phillips[l], H. Schmitter[m], P.M. Schneider[n], M. Stenersen[o]

Allelic ladders

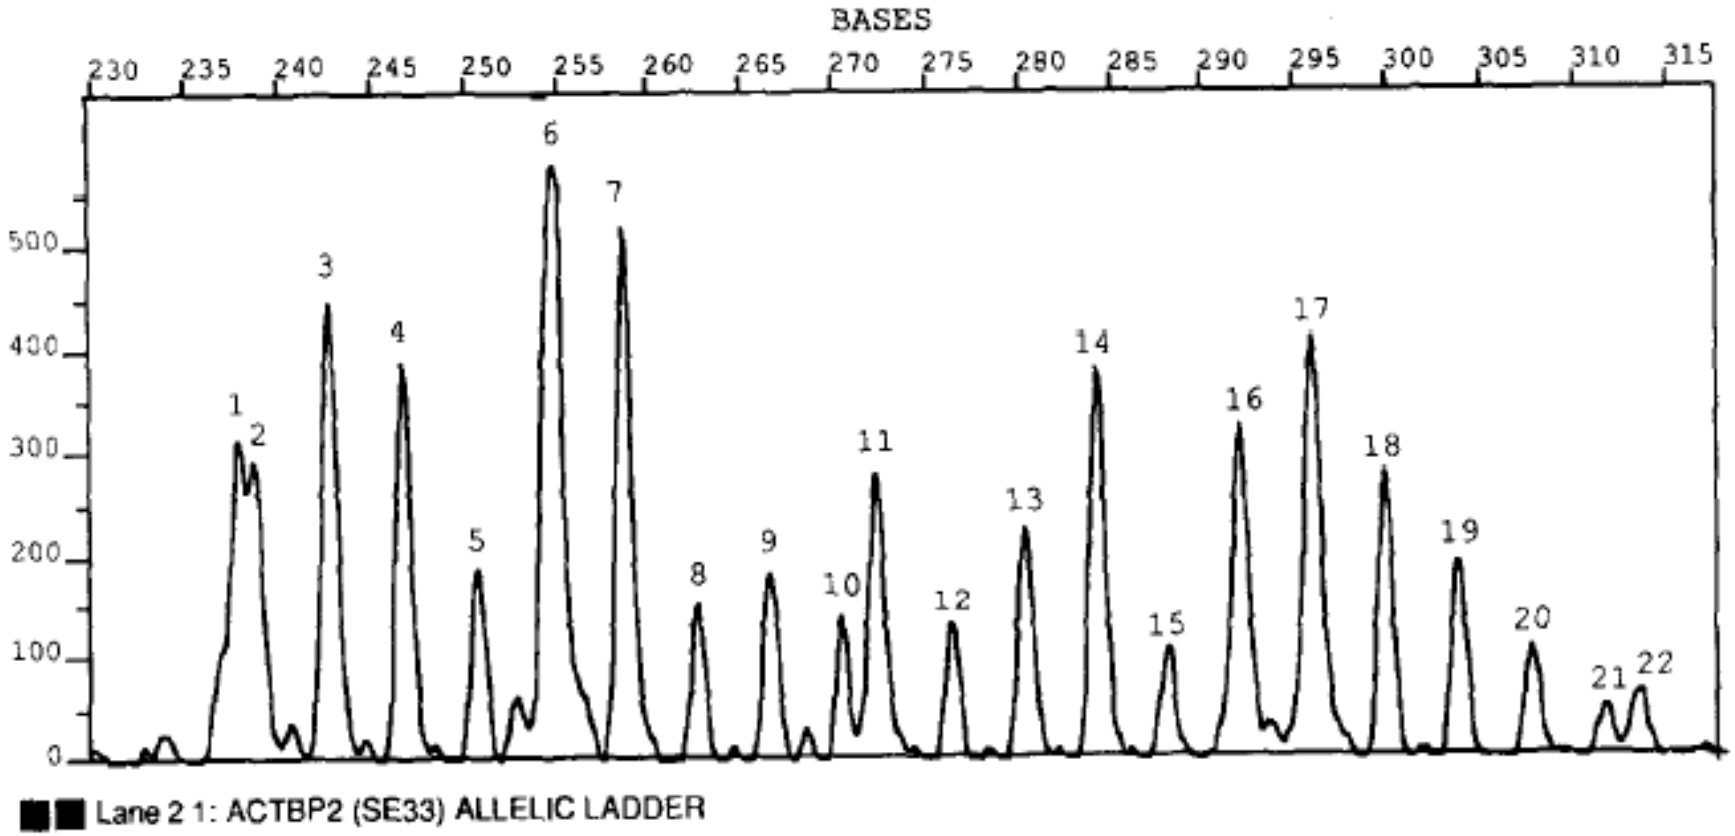

Fig. 2. Allelic ladder for HUMACTBP2 (SE33) analysed using the ABI automated sequencer. Allelic designation shown above each peak.

To summarise, the EDNAP exercise demonstrated that simple STR systems such as HUMTH01 are suitable candidates for standardisation even where diverse electrophoretic systems are utilised by different laboratories. Further work is required to characterise complex AT-rich loci (>30 alleles) because of difficulties encountered with the reproducibility of migration rates in different electrophoretic systems. For these systems, standardisation may not be possible unless common ladder markers and electrophoretic systems are used.

1993. The ISFH meeting at Venezia, Italy
The quadplex was introduced and an exercise carried out

Coimbra Portugal 1994 – the quadplex and first use of Fst. Variation between populations

Peter Gill presented some population information generated from the quadruplex of loci THO1, VWA, F13 and FES. Among fifteen populations obtained from various laboratories, he reported that the biggest variation in allelic frequency between different ethnic populations was in THO1. He reported a similar variation in allelic frequency between White Caucasian populations. Although the FSS and MPFSL routinely use a default frequency value of 5.0%, they also include an Fst kinship factor according to the formula produced by Nicholls and Balding:

$$P = C + (1-C)p$$ where C is the inbreeding coefficient

First discussions on national DNA databases (1994) and first mention of CE

3. Capillary electrophoresis

Ate Kloosterman reported that Beckmann have made considerable advances with the development of capillary electrophoresis for DNA analysis. It is now possible to obtain STR separations with a single base pair resolution and a throughput of 2 to 3 samples per hour. In order to increase the throughput work is continuing on automated sampling with multi-channel analysis. Each column is capable of 1000-2000 sample separations but each new column must be separately calibrated. He considered that it will be 1 to 2 years before the technology is sufficiently advanced for use in forensic science. **Peter Gill** informed members that ABI are also developing the technology.

Third collaborative exercise (1996)

ELSEVIER

Forensic Science International
78 (1996) 83–93

In summary, the results obtained from this collaborative EDNAP exercise demonstrate that the simple STR loci VWA and THO1 are good candidates for standardisation on an international scale. It is anticipated that the use of these systems will expedite cross-border exchange of information.

Report on the third EDNAP collaborative STR exercise

All EDNAP laboratories participating in this exercise successfully typed the DNA from five stains, including two of mixed origin, at the VWA and THO1 loci. This was achieved despite variation in the amplification, electrophoresis and detection systems utilised by individual laboratories. The results demonstrate that these simple STR loci are ideal for standardisation in the forensic community, where different laboratories have varying resources.

London, UK 1996. D21S11 and HUMFIBRA

- Nomenclature discussed

The discussion centred on the difficulties associated with the loci in which there is more than one repeating unit. There were differing recommendations offered to the meeting but the one which found universal favour concerned the production of an overall number for each fragment based on comparison with a known, defined allele. In order to achieve this it is necessary to have a comprehensive agreed internal ladder which would be used by all laboratories.

Brussels 1997 - STADNAP

- D21S11 and HUMFIBRA exercise reported
- The Oslo triplex – SE33, APOAII and D11S554
- Mitochondrial DNA – the first discussion and exercise
- The second and third generation multiplexes

A new combination of STR systems, TGM (third generation multiplex), is going to be introduced. The TGM will be used for further investigations when a match has been found in the intelligence database. The power of discrimination (PD) of the SGM is 10^{-7} and the combined PD of the SGM and TGM is 10^{-15}.

Herman Schmitter informed that, in Germany, it seems as if there is a growing interest in intelligence DNA databases.

PETER MARTIN

Thank you so much for the invitation to the EDNAP etc meeting. It is with regret that I will not be able to attend. There are many reasons but the major difficulty is getting from our home (in the middle of the French countryside) to Innsbruck which would require at least one extra overnight. This of course makes it very costly.

So , while I would love to meet some old friends and hear about progress I must decline your kind invitation.

Very best wishes for an excellent meeting.

Pete

DAVE WERRETT

ATE KLOOSTERMAN

BERND BRINKMANN

thank you for your mail.
Since I am a real founding member of the EDNAP and the creation of the name happened in Münster, I would have loved to come to the meeting in the alps.
Unfortunately I am unable to come, because I am only back from a journey to South Africa on November 5th.
Therefore, please understand, that I cannot.
In my professional life, the EDNAP and all the surrounding activities were really some of the greatest successes.
Of course, I would have loved to have seen you again and some of the old gang.

Many greetings
Yours
Bernd

WALTER BÄR

Thank you very much for the invitation. It would have been nice to remember the good old times but unfortunately I have a serious schedule problem which I cannot resolve. So I will let you celebrate „alone“ but I remember the successful times we had together.
I hope that everything goes well at Copenhagen and for yourself.
Very best wishes
Walter

HERMAN SCHMITTER

congratulations to EDNAP and its very successful 30 years. For I have‘nt lost contacts to my former collegues at BKA, i knew EDNAP still is working fine and I‘m sure it will do so for the following decades.
It‘s a pity, but for private reasons I‘m not able to follow your very kind invitation. Thus, it‘s left to me just to wish you a good and successful meeting -as EDNAP meetings allways used to be- and much pleasure by celebrating the 30 years anniversary.

Best wishes and kindest regards to all the collegues and friends of the EDNAP group.

Hermann

ERNESTO **d'ALOJA** 1993

BIRTHE ERIKSEN

PATRICK LINCOLN

30 years of EDNAP….it seems a long time ago in many ways…so many things happen/change but I remember so well us all sitting in a room and trying with Christian Rittner to come up with a name for the group and him saying EDNAP, EDNAP yes that sounds good!!
Thank you very much for your kind invitation to attend the Dinner and EDNAP meeting in Innsbruck in October. We really don't travel abroad these days, age I fear is catching up one way and another so I don't think I shall be accepting your invitation to attend. Sorry about that, I'm sure it will be a great occasion and certainly Innsbruck is a lovely place to have it not to mention the very attractive looking hotel!!
With warmest good wishes
Patrick

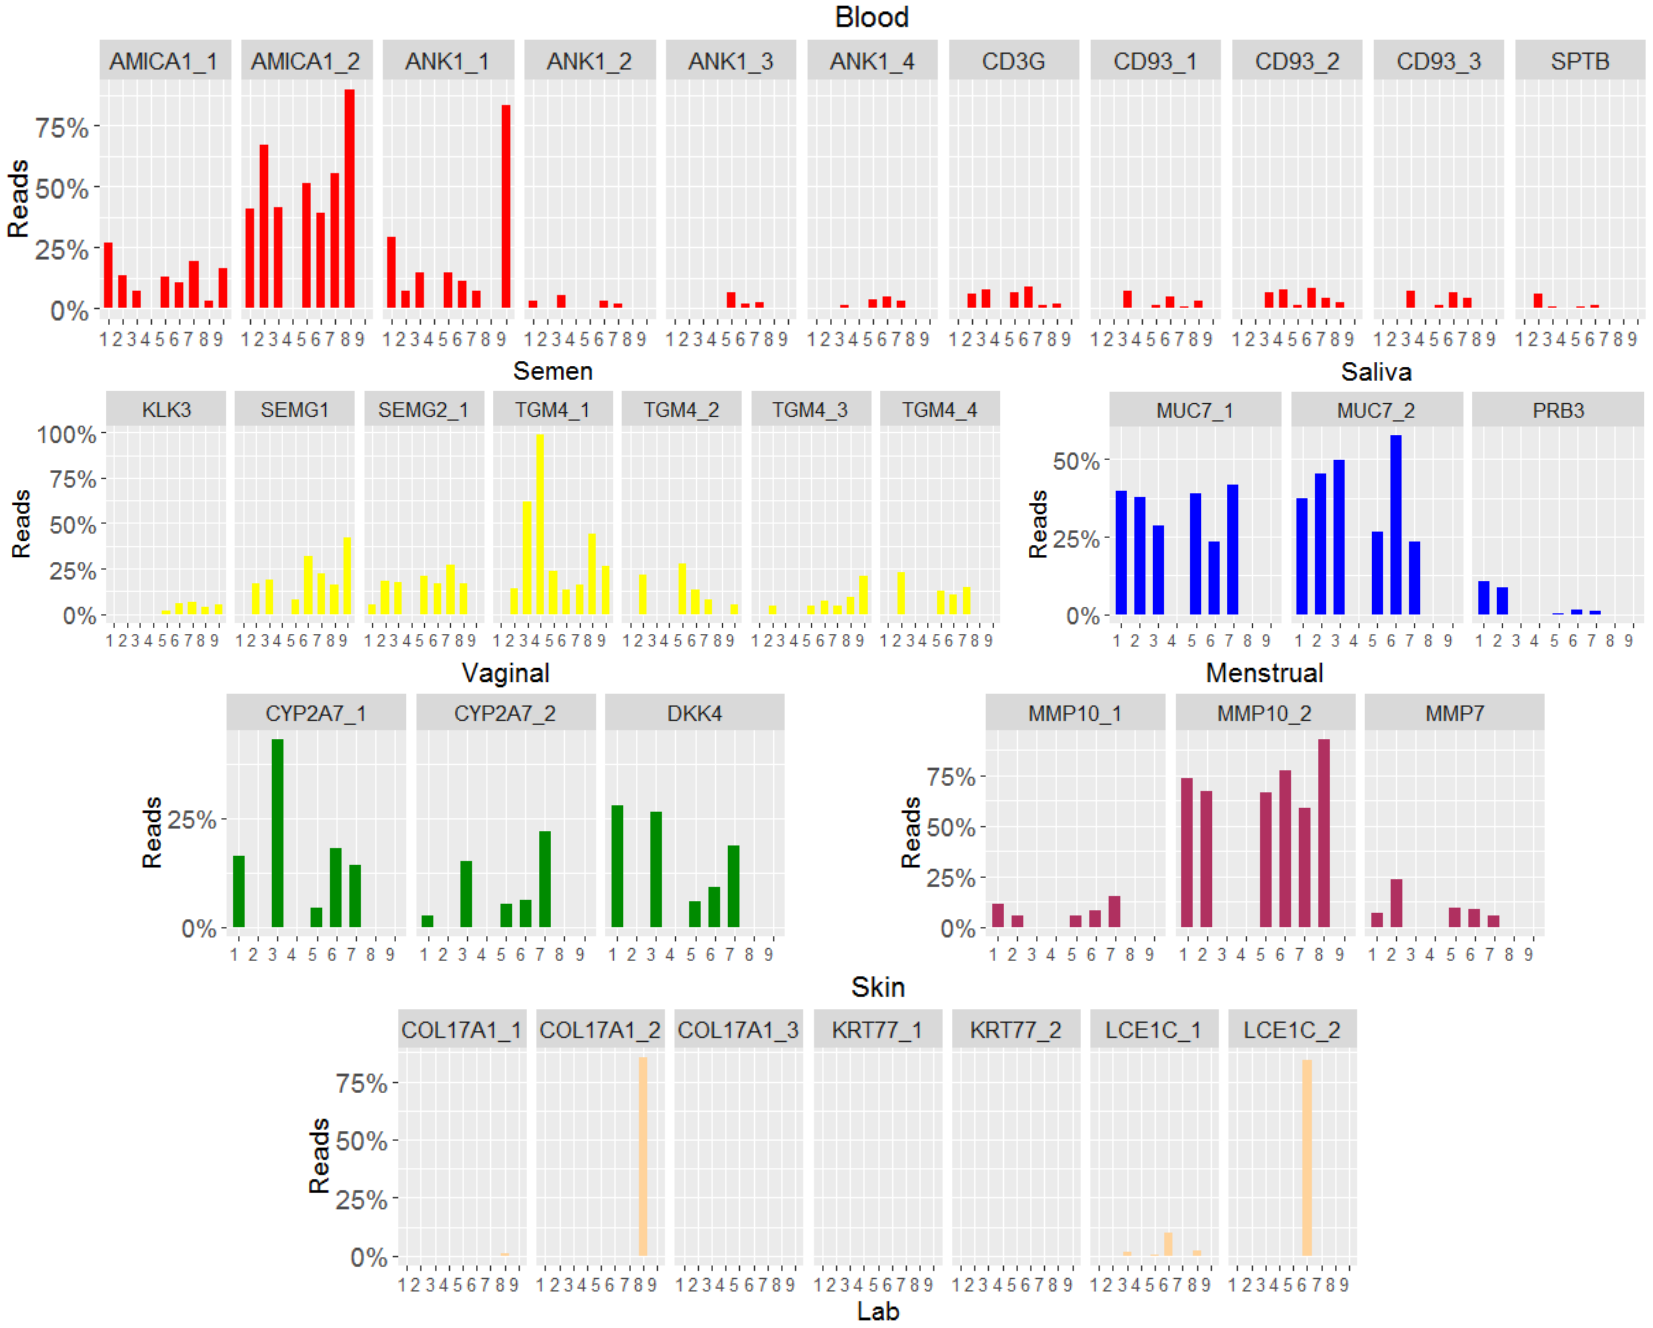
Comparison among laboratories (cSNP assay, single stains)



Overview - forensic stain analysis

DNA (STR profiling)

who is the donor of the DNA?

- **Enzymatic and immunological tests (presumptive tests)**
- **mRNA profiling**
- **miRNA profiling**

what type of cellular material is present?

- **cSNP profiling**

who contributed which body fluid in mixtures?

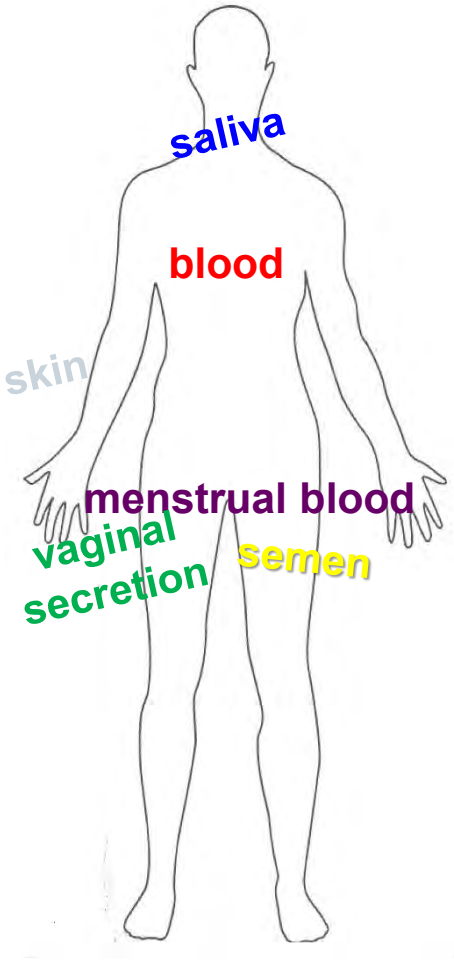
cSNPs = coding region SNPs

Body fluid / tissue specific SNPs

- In body fluid specific RNA we looked for SNPs that discriminate European individuals the most
- 34 off-the shelf cSNPs (MAF from 0.48 – 0.06)
- 3-11 markers per body fluid

cSNPs give a direct link between donors and body fluids

→ Identification of individual and body fluid



cSNP overview

Allele frequencies estimated from 188 European individuals

Body fluid	SNPs	PM
Blood	11	3.88E-4
Semen	7	2.77E-3
Skin	7	2.66E-3
Saliva	3	2.58E-1
Vaginal	3	1.76E-1
Menstrual	3	1.36E-1

Match probability per body fluid

cSNP profile – toy example

Blood - saliva mixture

cSNP stain profile (from RNA) only shows genotypes for blood and saliva markers

cSNP1	cSNP2	cSNP3	cSNP4	cSNP5	cSNP6	cSNP7	cSNP8	cSNP9	cSNP10
AA	AG	GT	CG	AT	GG				

Stain

cSNP reference profiles (from DNA) show genotypes for all markers

cSNP1	cSNP2	cSNP3	cSNP4	cSNP5	cSNP6	cSNP7	cSNP8	cSNP9	cSNP10
AA	AG	GT	GT	AA	CG	AG	CT	CC	GT

Donor 1

cSNP1	cSNP2	cSNP3	cSNP4	cSNP5	cSNP6	cSNP7	cSNP8	cSNP9	cSNP10
AG	AA	GG	CG	AT	GG	AG	CT	CC	GT

Donor 2

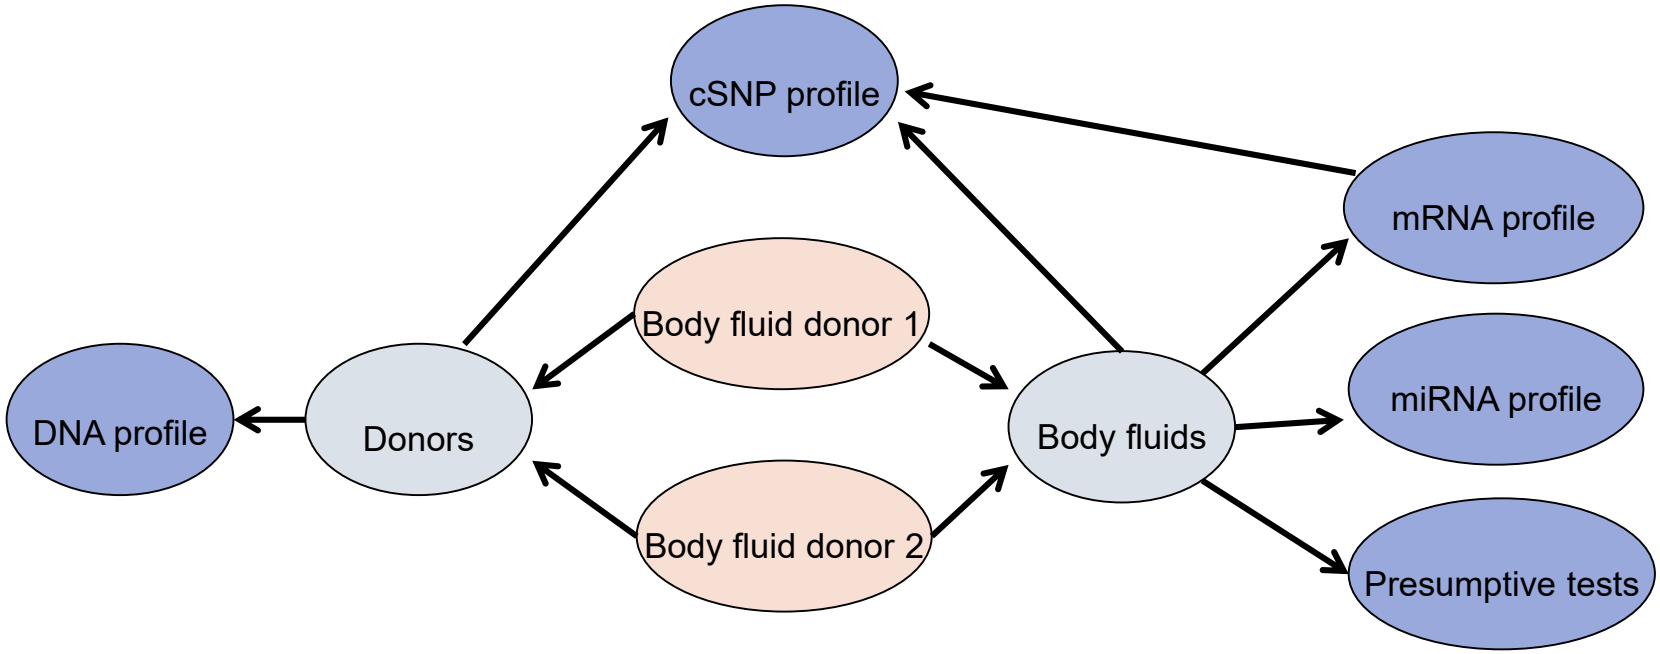
cSNP profile – a real data example

Blood – saliva mixture (blood 5 SNPs, saliva 1 SNP, remaining 6 blood and 2 saliva SNPs not discriminatory for this example)

Sample/ Marker	ANK1_2	ANK1_3	ANK1_4	AMICA1_1	CD3G	MUC7_2
Donor 1 (DNA)	GG	CT	GG	AA	AA	CG
Donor 2 (DNA)	GA	CC	GA	AG	AG	CC
blood-saliva mix (RNA)	GG G: 947 A: 4	CT C: 1604 T: 2940	GG G: 8619 A: 4	AA A: 9489 G: 32	AA A: 6522 G: 13	CC C: 2073 G: 1

Combine evidence on different levels with a Bayesian network

- DNA profile assists in identifying the donors
- RNA profile/presumptive tests assist in identifying the body fluids
- cSNP profile helps to link a donor to a specific body fluid
- Additional case related information



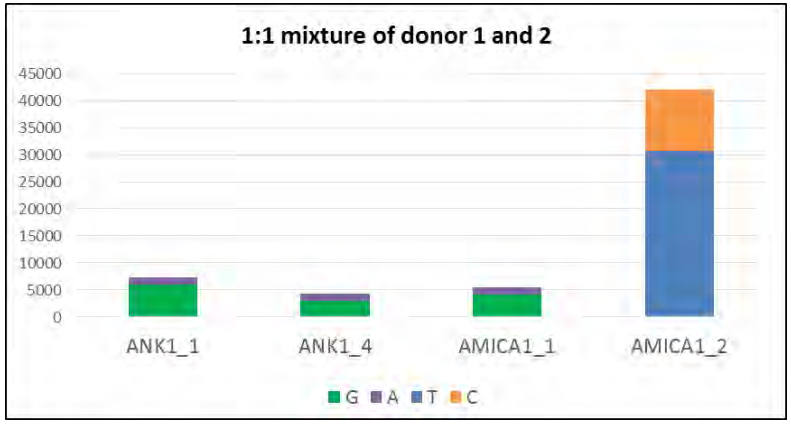
cSNP profile – mixture of same body fluid

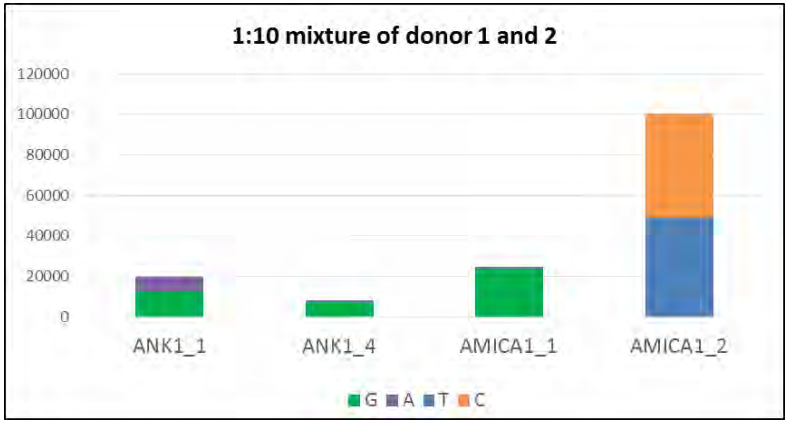
Real data example: blood – blood mixture

(blood 4 SNPs, remaining 7 blood SNPs not discriminatory for this example)

	Sample/ Marker	ANK1_1		ANK1_4		AMICA1_1		AMICA1_2	
1x	Donor 1 (DNA)	G	G	G	A	G	A	T	T
10x	Donor 2 (DNA)	G	A	G	G	G	G	T	C

Read counts reflect the mixture proportions





With only one donor we would expect a 1:1 ratio for heterozygous SNPs

cSNP discussion

- Analysis of RNA/cSNP in stains is challenging
  - RNA easily degrades - some alleles drop out
  - Residual DNA in RNA extract - markers for body fluids not present “drop in”
  - Heterozygote read count ratio can deviate from an expected 1:1 ratio, due to stochastic amplification processes with low template targets
  - → Inconsistencies between reference profiles and stain/mixture profile
  - → Not useful for mixture deconvolution
- Combining evidence – DNA, RNA and cSNP
- Need more suitable markers → Simultaneous identification of individual and body fluid

Manuscripts in preparation

1) cSNP proof of concept paper
   - 12 single source samples, 51 mixtures
   - STRs, mRNA, cSNPs
   - Statistics

2) Collaborative exercise mRNA NGS part 2
   - 10 labs, 9 data sets
   - 16 samples
   - TOP6 and cSNP data
   - Statistics

Thermofisher cSNP assay

- blood, semen, saliva, vaginal, menstrual and skin
- cSNP amplicons are useful for body fluid identification
- some marker overlap between the MiSeq cSNP assay and TF assay
- first trial experiment → genotypes can be distinguished for most of the body fluids, even amongst a small number of donors → good discrimination at the cSNP level

→ Possible collaborative exercise in 2019

Thank you for your attention!

EDNAP mini-Exercise proposal mtDNA quant

Kris van der Gaag
Natalie Weiler
Titia Sijen
Arnoud Kal

Calibration of equipment

The exercise assay uses four colors, you will need to calibrate your equipment for the following labels as shown below. Unfortunately we cannot supply these reagents.

Label	Catalog nr. ThermoFisher Scientific	Description
FAM / VIC	4349180 (usually calibrated during service)	7500 Real Time PCR Systems Spectral Calibration Kit I
ABY	A24738	ABY™ Dye Spectral Calibration Plate for Multiplex qPCR, 96-well
JUN	A24737	JUN™ Dye Spectral Calibration Plate for Multiplex qPCR, 96-well
Mustang Purple	4461599	MUSTANG PURPLE™ Dye Spectral Calibration Plate, 96-well

What we need from you

We will need one contact person for each lab that will join the exercise. Please send us the postal address and the email address of your contact person via email to a.kal@nfi.minvenj.nl, k.van.der.gaag@nfi.minvenj.nl and n.weiler@nfi.minvenj.nl . Your contact person will be notified when the samples are shipped.

Questions?

Please do not hesitate to ask us if anything is unclear.

Best wishes,

Arnoud, Kris, Natalie and Titia

Dear Friends,

The mini-exercise mtDNA quantification has been delayed for several reasons. My apologies to all of you who have been waiting for news and answers to questions. Fortunately we can give you more detailed information now. We are planning to send out the exercise within the next few weeks.

Setup of the assay

We developed a DNA-quantification assay using four different targets:

- autosomal DNA
- Y-chromosomal DNA
- mitochondrial DNA (long fragment 217 bp)
- mitochondrial DNA (short fragment 70 bp)

We will provide primers, probes, protocols and interesting samples. You can also test your own favorite samples and your own quantification method(s).

Setup of the exercise

In the exercise, you will test the following samples with the exercise protocol and reagents and also with your own protocol and reagents:

- 8 samples provided by the NFI (in triplicate)
- 8 standards, provided by the NFI (in duplicate)
- 4 samples, provided by you

We will also ask you for your interpretation of the quantification results. What do these results tell you about the sample?

Shipment of samples

To save costs, we will send you the samples and reagents via regular mail instead of frozen on dry ice. Templates are stable at high concentration, you will be asked to prepare dilutions in your own lab.

Welcome!

The ENFSI - **European Network of Forensic Science Institutes** is an interactive platform intended to bring together the forensic experts in Europe, allowing them to get involved with the content displayed. All users are advised to subscribe to every **Blog** and **Forum** in order to be timely notified on new posts/entries. It is possible to subscribe to the entire Forum, to a category or to a specific thread.

To get familiar with EPE please have a look here.

BPM/guideline principles ENFSI

Official BPM and guideline templates approved by the board (12/2017)

- BPM: field specific document describing the principles of the methods used, instrumentation, QA … written in general terms, aimed at practitioners
- Guideline: gives recommendations or clarifications, aimed at practitioners

BPM Human DNA Analysis

Scope agreed in 2017:

This document provides guidance on general accepted procedures and workflows for processing human DNA evidence; starting from the collection to the presentation of the findings, including requirements related to personnel, material and environment. It also refers to generally applied methods, their validation and quality control.

4 task forces

Task force	document(s)	Task
1	BPM DNA pattern recognition and comparison	Revising of the existing BPM to a guideline
2	BPM Human DNA Analysis	Writing of BPM to cover the general accepted procedures and workflows for the processing of human DNA; from the collection of evidence to the reporting of findings
3	Guideline: Training of DNA staff Guideline: ENFSI Quality Assurance Program for DNA Laboratories	Update the Guideline for the training of staff working in the forensic DNA laboratory Update the Guideline regarding the ENFSI Quality Assurance Program for DNA Laboratories
4	Guideline: 'Minimum Criteria for the Validation of Various Aspects of the DNA Profiling Process'	Update the Guideline regarding the minimum criteria for the validation of various aspects of the DNA profiling process

Current Situation – May 2018

EU Direct Grants to ENFSI

	Grant Agreement
2009	€ 499,973
2010	€ 582,113
2011	€ 646,931
2012	€ 537,982
2013	€ 645,649
2014	€ 1,425,821
2016	€ 1,500,000

> € 5.8 million

New signed Grant Agreement Implementation Started 1st Jan 2018 →

Direct Grant Programme Themes Selected by ENFSI Board

MP2009

Sustainable Quality Within European Forensic Science (SQWEFS)

MP2010

Strengthening the Evaluation of Forensic Results across Europe (STEOFRAE)

MP2011

Improving Forensic Methodologies across Europe (IFMAE)

MP2012

Towards European Forensic Standardisation through Best Practice Manuals (TEFSBPM)

MP2013

Towards the Vision for European Forensic Science 2020 (TVEFS-2020)

MP2014

Towards the Development of Pan-European Databases in Forensic Science (TDPEDFS)

MP2016

Steps Towards a European Forensic Science Area (STEFA)

Direct Grant 2016 projects (Monopoly)

Period 2018- 2019

- Empowering Forensic Genetic DNA Databases for the Interpretation of Next Generation Sequencing Profiles (DNA.bases) N7 M2016
  - Ingo Bastisch

- Preparation of a Collaborative Exercise covering the forensic disciplines of DNA, document examination, fingerprint examination and handwriting examination
  - Jonathan Morris (Chair ENFHEX EWG)

New proposals

European Commissions invite to ENFSI

ISF Police Annual Work Programme 2018

Proposals for actions 5 and 6 of the EFSA2020 Action Plan

- Stimulate accreditation of forensic service providers and competence of forensic personnel on a voluntary basis.
- Stimulating exchange of forensic data via Prüm and improving its quality.

- Total amount € 1 500 000.
- Projects max 24 months.
- Outline for projects/team leads/members 15 November 2018 > ENFSI board
- Project submission by 21 February 2019 > ISF

ENFSI board proposals

A. Accreditation of Digital Forensics and Scene of Crime Services
B. Training of Forensic Personnel in Accreditation Matters
C. Awareness Training of Stake Holders
D. Training of Technical Assessors
E. Production of New and/or Updated Best Practice Manuals (BPMs)
F. Proficiency Testing Across Europe
G. Other Work Packages?

EMPOP Update

Dr. Walther Parson
assoc. Prof. Institute of Legal Medicine, Medical University of Innsbruck, Austria
adj. Prof. Forensic Science Program, Penn State University, PA, USA
walther.parson@i-med.ac.at

EMPOP

17 August 1999 San Francisco, CA, USA

18th ISFH World Congress (G. Sensabaugh)

759 members
Name change to ISFG

Elected board:

President: A. Carracedo
Vice president: B. Olaisen
Secretary: W. Mayr
Treasurer: N. Morling
Representative of the Working Groups: P. Schneider

Chris Phillips

"The DNA commission had a meeting in San Francisco and will publish in due course recommendations concerning mt-DNA" (Carracedo et al 2000)

Around this time N. Morling suggested the development of a centrally curated forensic mtDNA database

8 May 2000 Dublin, Ireland

5. Suggestion for an EDNAP mtDNA database Walther Parson

A draft description of the project is attached at Annex 7

Two mtDNA databases are already in existence; one from the FBI and the other from Germany. The proposal is that there should be an open database on the Internet that is maintained by EDNAP. The acronym EMPOP was suggested for 'The EDNAP mitochondria DNA Population Database Project'.

The pilot project, which has been set up in Innsbruck, uses software that can check input data to ensure that it is a sensible result. Statistical data on major ethnic types and sub-affiliations is included. The software also records who has accessed the database and what has been searched.

8 May 2000 Dublin, Ireland

Richard Scheithauer guarantied that the Innsbruck laboratory can maintain a mtDNA database for at least 5 years.

The members agreed that they would be happy to have EMPOP under the EDNAP umbrella.

As it is essential to maintain quality standards it might be necessary to have proficiency testing on those who will input data.

Alignment-free query engine for unbiased search results and pyhlogenetic alignment of mtDNA sequences

EMPOP uses SAM2, a string-based search algorithm that converts query and database sequences into alignment-free nucleotide strings and thus guarantees that a haplotype is found in a database query regardless of its alignment.

Furthermore, SAM2 provides the phylogenetic alignment of mtDNA sequences to harmonize alignment and notation of mtDNA sequences.

Harmonizing Alignment

EMPOP 4

Query | Result | Details | Neighbors | **Alignment** | Haplogrouping

Phylogenetic alignment

Input Profile	263G	315.1C	523-	524-	16183-			
Phylogenetic alignment	263G	315.1C	523-	524-	16183C	16188T	16189C	16193-

Alignment was estimated using SAM 2.0 on the basis of 5,440 haplogroup motifs (Phylotree, Build 17) following the phylogenetic concept and the recommendations of the ISFG and was derived from haplogroup

Frequencies

These tables include allele frequencies and number of samples (n) from the most recent database release sorted by marker and country.
In these tables, „1" represents all rare alleles shorter than the accepted allele categories. The value „99" represents all rare alleles longer than the accepted categories.

This data can be downloaded as XML file.

Research paper

Open source software EuroForMix can be used to analyse complex SNP mixtures

Øyvind Bleka[a], Mayra Eduardoff[b], Carla Santos[c], Chris Phillips[c], Walther Parson[b,d], Peter Gill[a,e,*]

[a] Department of Forensic Sciences, Oslo University Hospital, Norway
[b] Institute of Legal Medicine, Medical University of Innsbruck, Austria
[c] Forensic Genetics Unit, Institute of Forensic Sciences, University of Santiago de Compostela, Spain
[d] Forensic Science Program, The Pennsylvania State University, PA, USA
[e] Department of Clinical Medicine, University of Oslo, Norway

Development of a community of users

- Advantages:
  - Transparency
  - Available to all users without restriction
  - Peer review and standardisation
  - Enables adoption of (same)software by different providers
  - Encourages a community of users approach
  - Encourages cascade training of users because training materials are supplied
  - Central help desk
  - Support is provided to users for court-going purposes
  - A highly cost effective approach to adoption of fully validated methods that are supported by regular updates to programs
- From last count there are c. 40 labs using open-source in Europe.

Adoption by other providers

- DNA*xs* under development by NFI will use Euroformix as a core program to be re-written in Java
- Euroformix has been adopted by a US company ‘genetic technologies’ as “BulletProof”
- They have rewritten the gui and it has some nice features – of course the core program is the same
- Open-source has flexibility of approach that allows users to adopt the core program and to change the ‘wrapper’ according to local requirements.

ISFG Summer school

Interpretation of complex DNA profile mixtures using open-source software including LRmix and EuroForMix

Teachers:

Peter Gill (University of Oslo Hospital)
Lourdes Prieto (University of Santiago de Compostela)
Oyvind Bleka (University of Oslo Hospital)
Corina Benschop (Netherlands Forensic Institute)

Aim: To provide participants with necessary skills to carry out probabilistic genotyping of complex mixtures using open-source programs to calculate the strength of evidence of complex mixtures.

Target Group: Law enforcement forensic experts – experienced reporting officers who deal routinely with DNA profiling evidence and are required to interpret complex mixtures in casework.

General Learning Outcomes:

- Understand the theory behind using likelihood ratios to interpret evidence
- Discuss the theory used to interpret complex mixtures of two or more contributors where the samples may be compromised - partial, degraded
- Describe best practice in relation to the ISFG DNA commission recommendations
- Be proficient in the use of open source software in order to carry out the calculations (LRmix Studio, EuroForMix, Case Solver)
- Write court going statements
- Describe the limitations of methods
- Demonstrate extension to Massive Parallel sequencing data for STRs and SNPs
- New developments will be disseminated, including DNAxs, a new package for reporting officers
- Participants will be provided with necessary tools to carry out cascade training at a national level

Software

Software

All software are open-source and freely available for users. Free support is provided to users via help desks found on the web-sites.

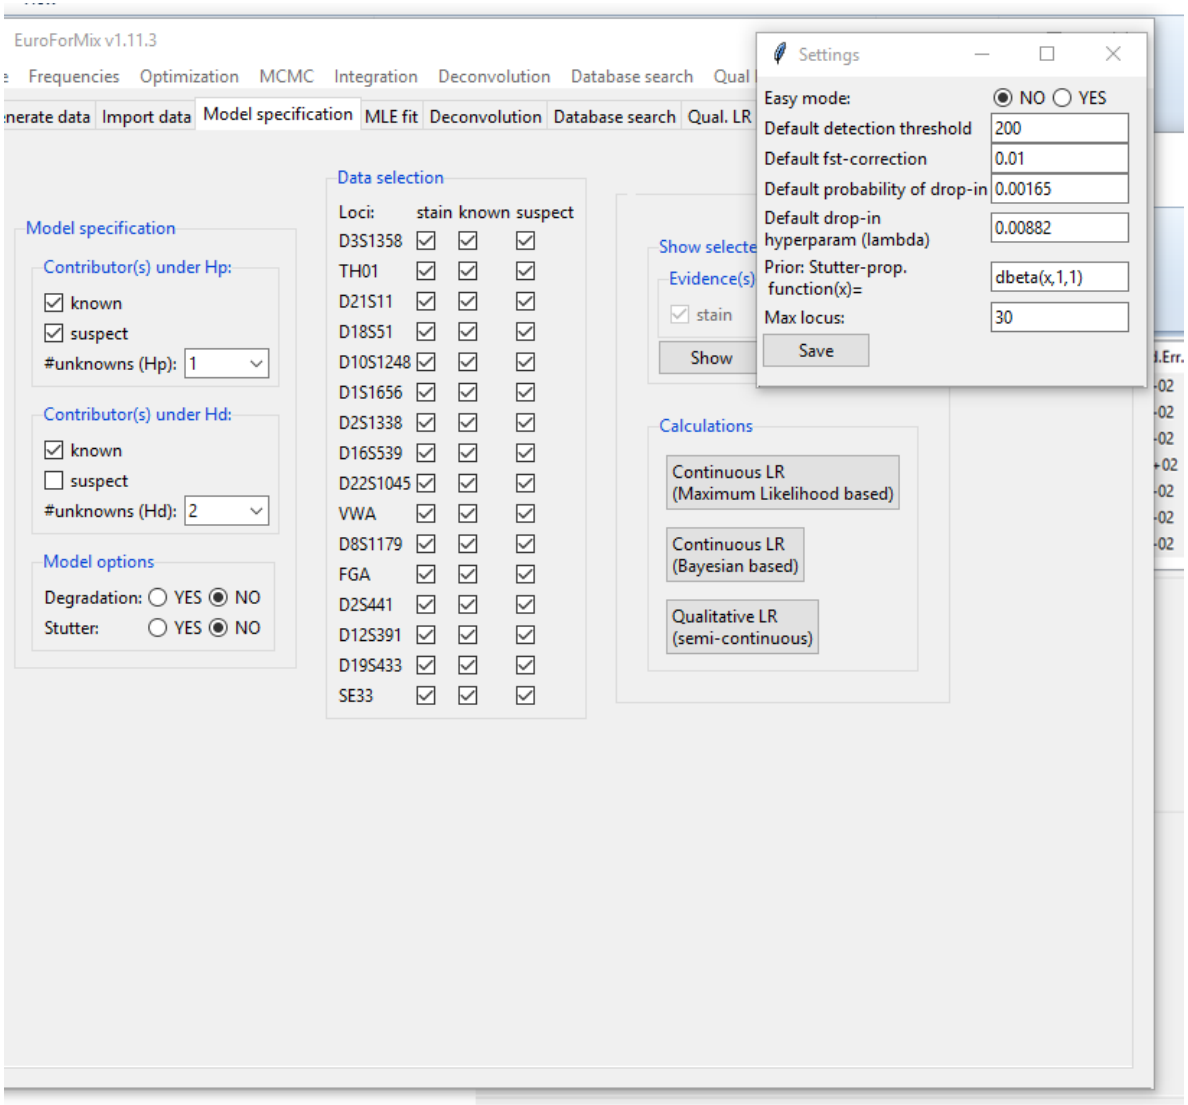
LRmix studio is a commonly used *qualitative* program that utilises the peak designation only http://lrmixstudio.org/.

EuroForMix is a more complicated *quantitative* program. Its development was supported by a EU-FP7 inititative (EuroForGen-NOE). Peak height, stutter and degradation are incorportated into the model. This package is 'state of the art', and is also used for analysis of massive parallel sequencing data http://www.euroformix.com/

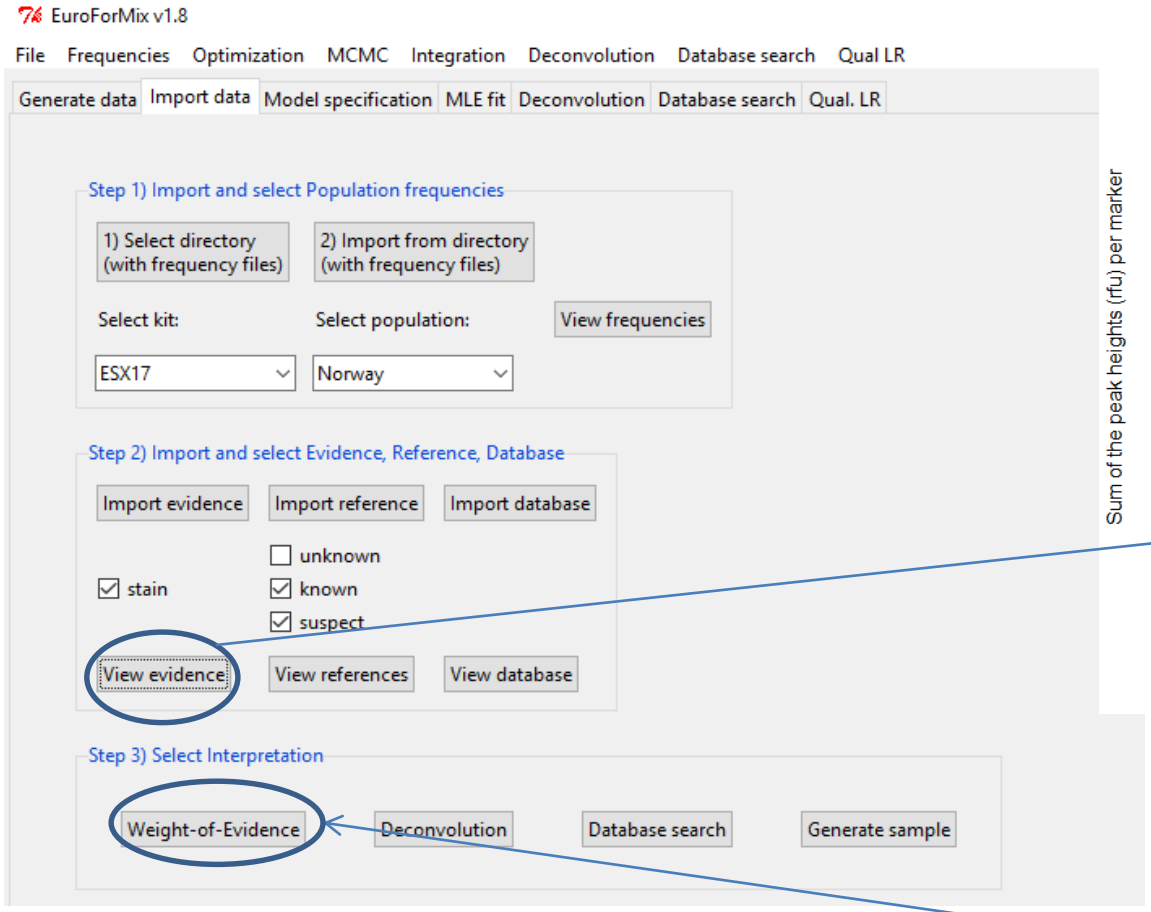
Case Solver is a program that is linked with EuroForMix. It is used to automate the analysis of complex cases where there may be multiple suspects and crime-stains http://www.euroformix.com/.

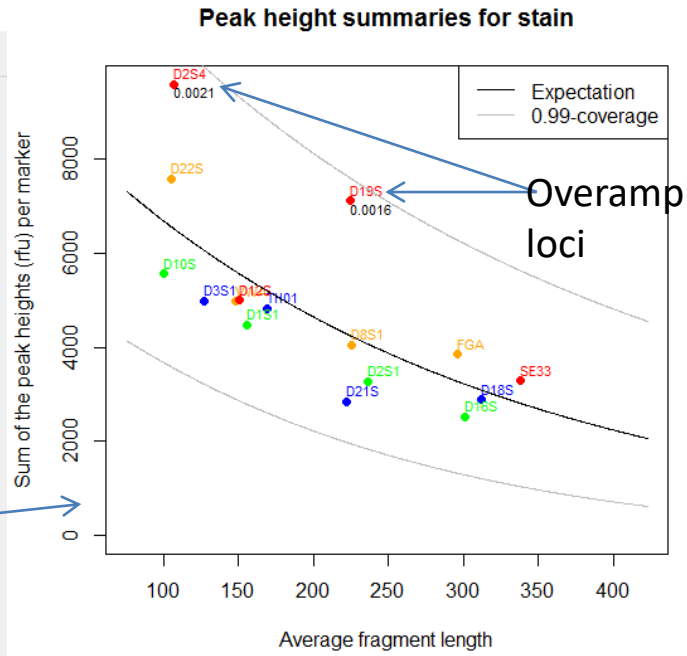
DNAxs is a new program under development by the NFI. EuroForMix will be integrated into this package, along with a host of features designed to assist the reporting officer to interpret complex DNA profiles. Corina Benschop will provide feedback and demonstrate program features.

Numbers of contributors (robber case) step 1: load settings



Euroformix Analysis
Step 1b: load the samples





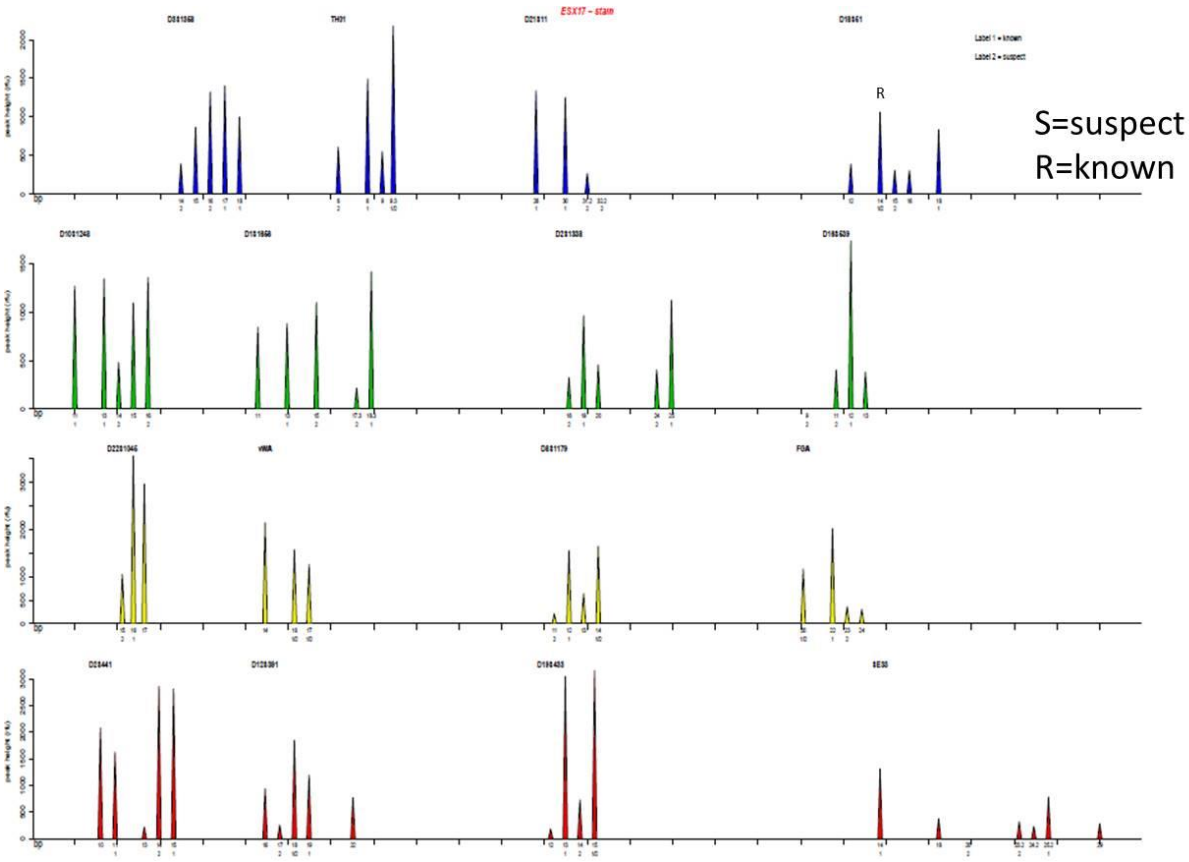
Overamplified loci

Note that it is easiest to go to the File tab and load the project from ‘robberSample’

Click on this button next

Numbers of contributors (robber case)

- Some advice



Estimation of numbers of contributors is not just about the maximum number of alleles in the profile (SE33 example)

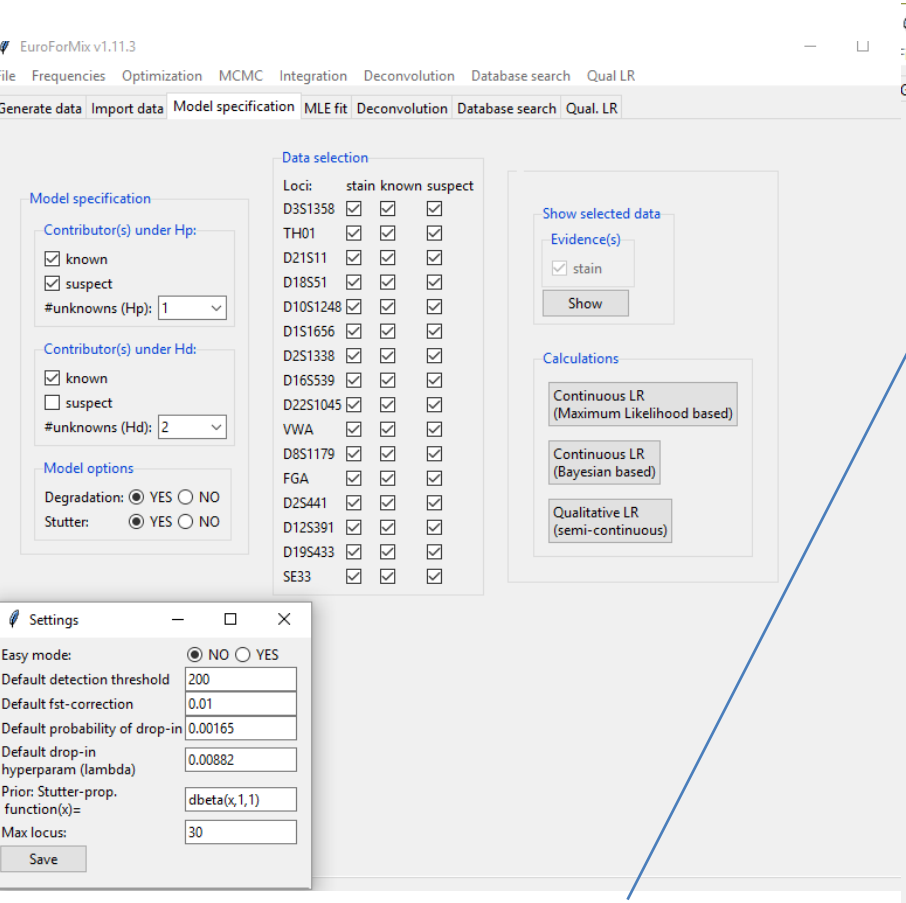
	Alleles in the crime-stain						Alleles in references			
Conditioning hypothesis	**1**	**2**	**3**	**4**	**5**	**6**	**Known**	**Suspect**	**List of unique alleles**	**Minimum no. of contributors**
Hp	14	18	23.2	24.2	25.2	29	14, 25.2	23.2, 20	14,18,20,23.2,24.2,25.2,29	4
Hd	14	18	23.2	24.2	25.2	29	14, 25.2		14,18,23.2,24.2,25.2,29	3
Peak heights	1312	373	318	229	779	279				

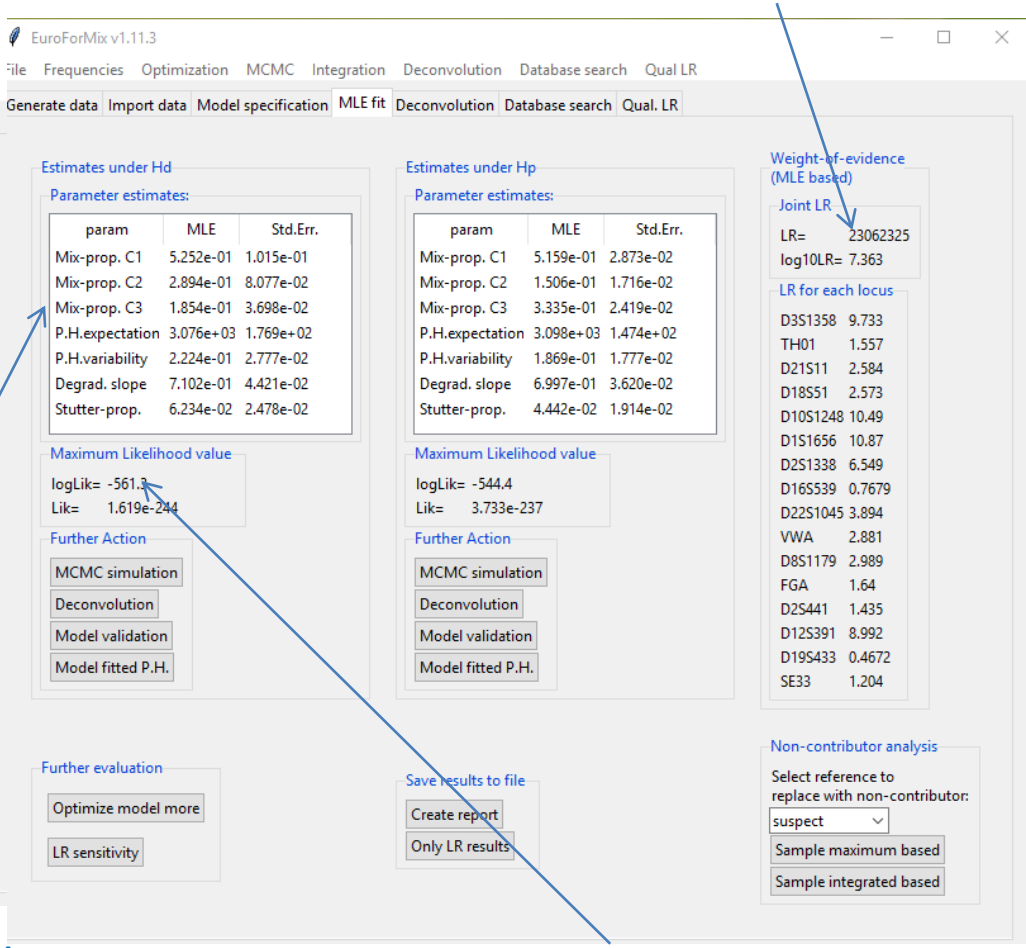
- First find the minimum number of contributors needed to explain the profile
- It is necessary to add together the unique alleles in the profile plus the conditioned genotypes
- These may be different under Hp and Hd.

Why doesn’t it make any difference if we postulate too many contributors?

Determine the best model. 2 minutes to compute 3 person mixture with stutter/deg

(unadjusted) LR

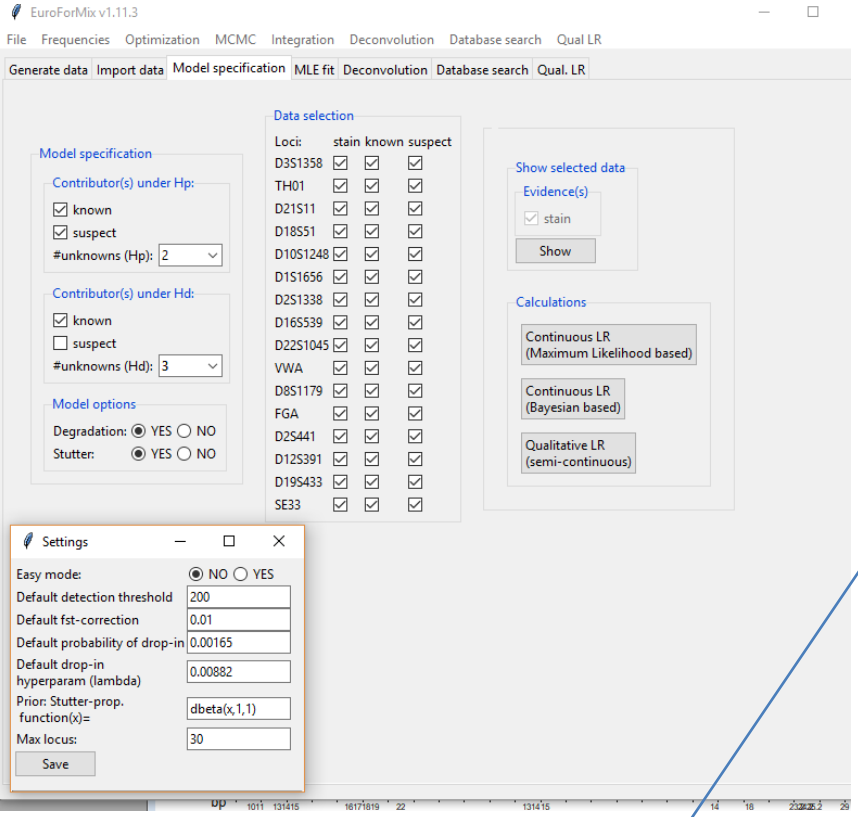


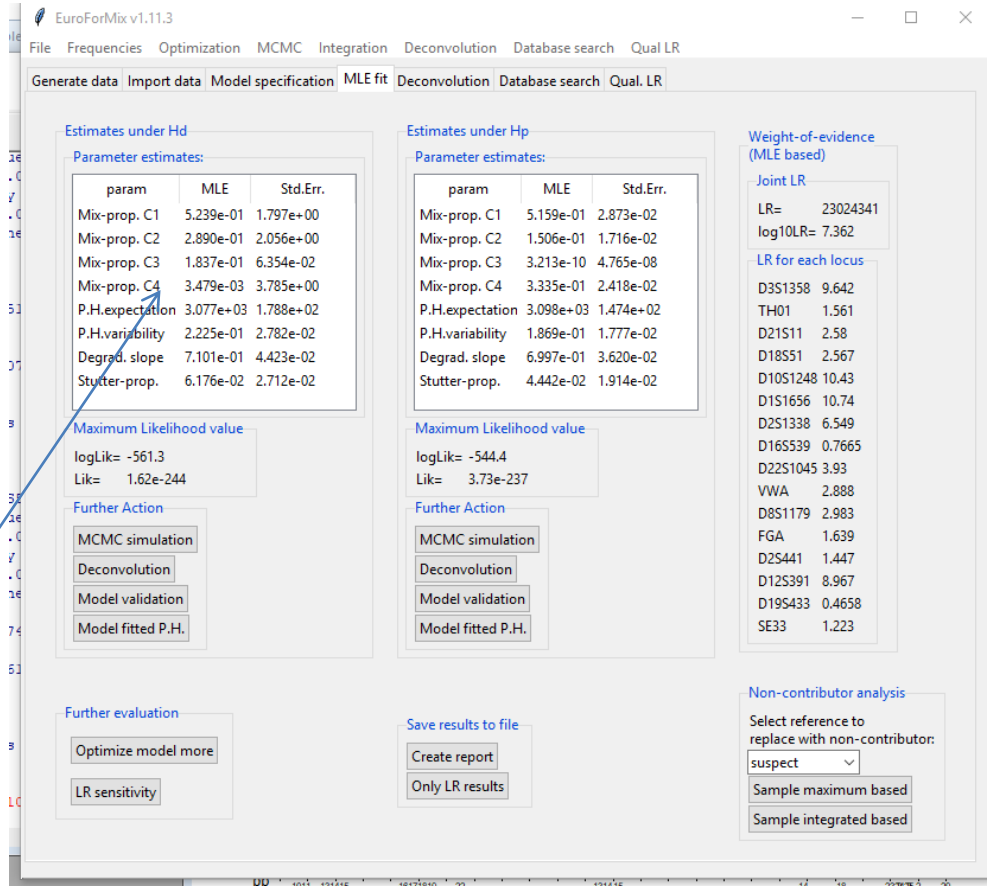


Check the mixture proportions: 0.525;0.289;0.185

Record the LogLik

Step 3: Determine the best model 120mins to compute 4 persons with stutter/deg





Mx =0.003 is very low

We can carry out multiple analyses for various contributors

- LRs are different but the best fit model is denoted by the Log Likelihood value.

EuroForMix analysis							The reported log10LR	
K	**Stutter**	**Degrad.**	**#param.**	**LogLik**	**adjusted LogLik**	**log10LR**	**EFM**	**LRmix Studio**
3	no	no	0	-577.7	-577.7	2.6	1.15	-2.85
3	no	yes	-1	-567.3	-568.3	4.5		
3	yes	no	-1	-572.7	-573.6	4.7		
3	yes	yes	-2	-561.3	**-563.3**	**7.4**	**5.44**	
4	no	no	-1	-574.9	-575.9	4	**1.94**	**1.62**
4	no	yes	-2	-564.3	-566.3	6.5		
4	yes	no	-2	-572.7	-574.7	4.6		
4	yes	yes	-3	-561.3	-564.3	7.4	6.1	
Hp=4;Hd=3	yes	yes	-2.5	-561.3	-563.8	7.4	6.3	-0.22

Summary of guidance

- To determine the number of contributors try out different numbers using exploratory analysis.
- Check whether an additional contributor is significant. If it is very low (Mx=0.001) in the example then it doesn’t make any difference.
- Decide the best model to use with LogLik analysis.

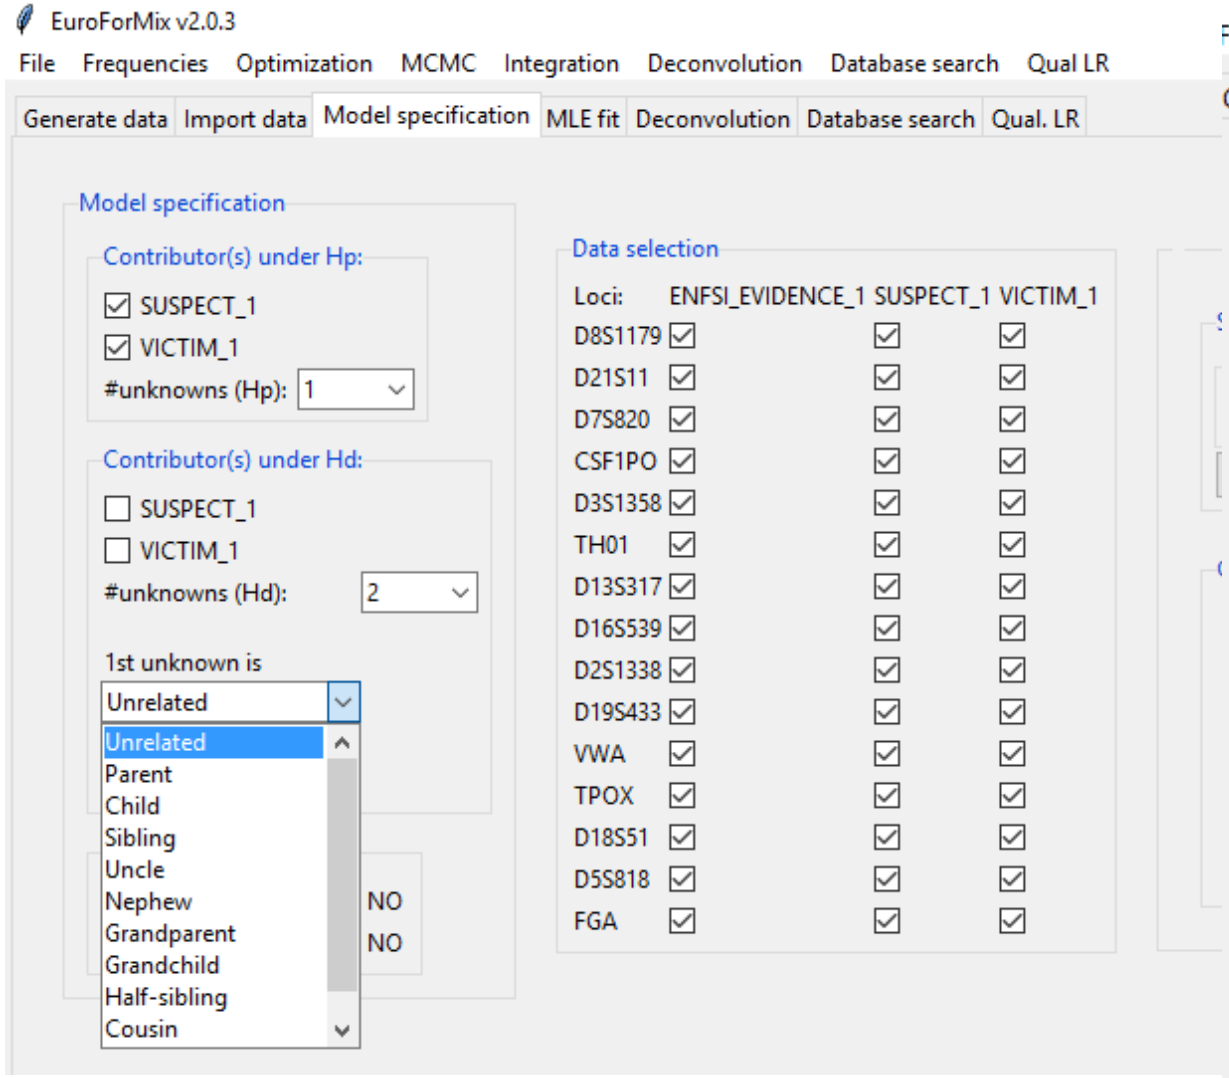
Conclusion

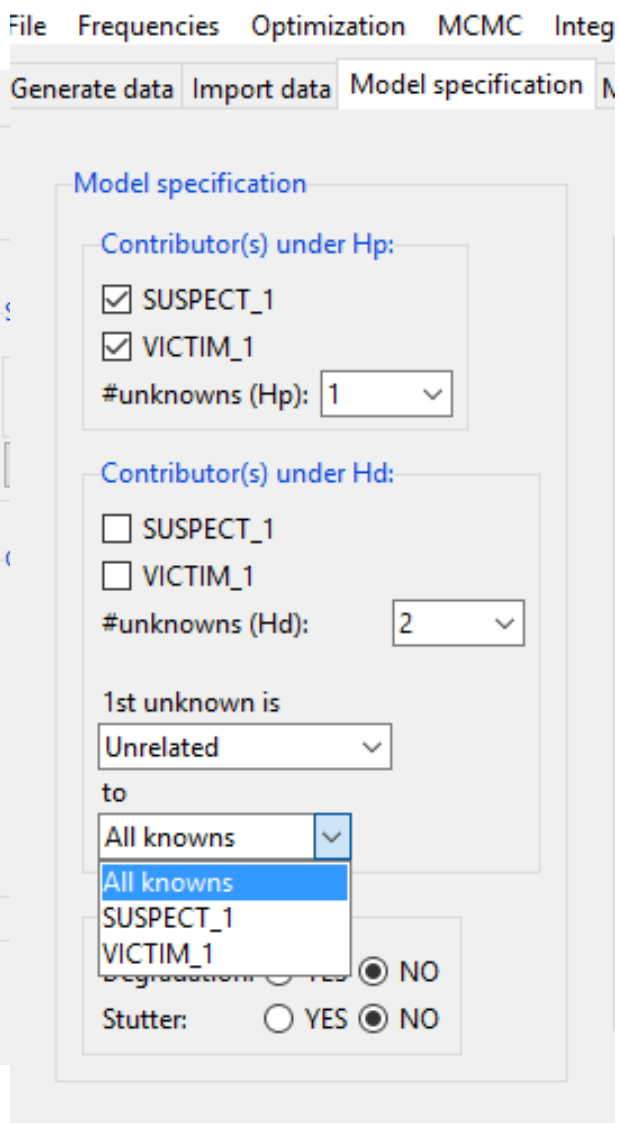
- We never know the number of contributors
- It really doesn’t matter, so long as we choose sufficient to explain the profile.
- If too many contributors are chosen, a good model will assign excess contributors a very low Mx

Euroformix version 2 release

- New update
- Supports NGS SNPs and STRs
- Forenseq multiplex is coded into the latest package

Latest developments relatedness tests





Speed of analysis is greatly improved

- 5 person mixture (with conditioning one person under Hd/Hp) can now be achieved in approximately 3 hours (instead of 18 hours with previous version).

Case Solver

- Continued development
- Now possible to use conditioning profiles
- Very fast software used to investigate unlimited numbers of stains and reference samples – in fact entire databases can be used.
- Practical limitation of number of contributors=3
- Investigative tool

Education

- It is important that biologists can understand the software mechanism
- There is a barrier between statisticians and biologists which inhibits understanding.
- Use of complicated formulae
- Solution is to prepare simple explanations that are spreadsheet based so that users can explore the formular behind the spreadsheet.

Educational initiative
Explaining how does it work?

- Mastermix excel spreadsheet has been expanded to include the determination of probabilistic weights

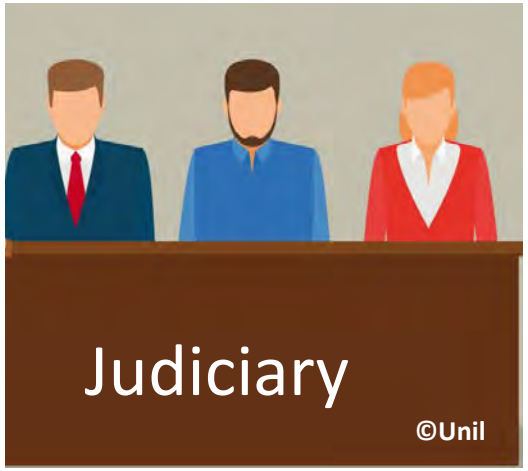
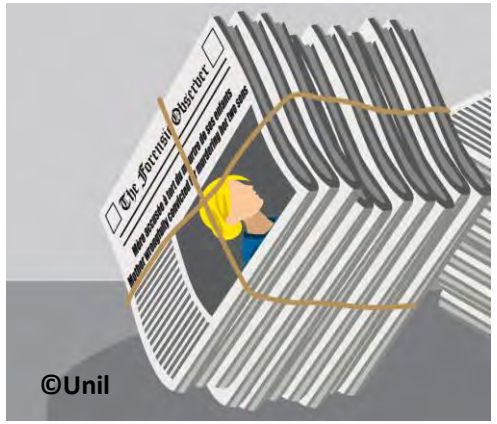
MOOC Challenging forensic science: how Science should speak to Court

Christophe Champod, Franco Taroni
Alex Biedermann, Tacha Hicks

Assessing and conveying the value of forensic science results is a challenge for all stakeholders:





Media

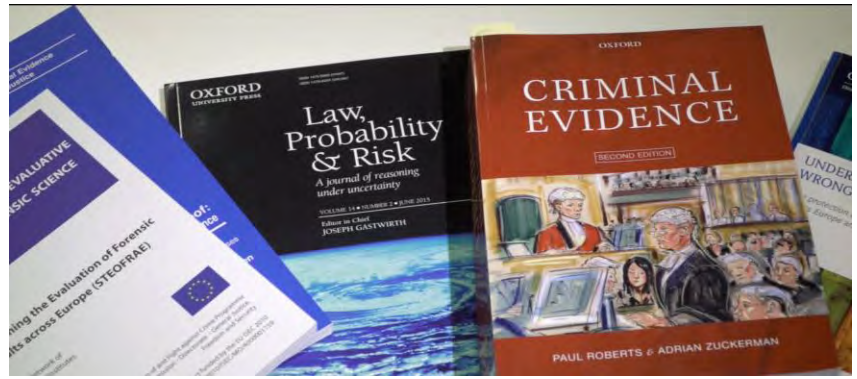
General public

100% scientific certainty…

We must go beyond conventional image that is promoted through TV series.

Alert on the limits of the techniques for sound administration of forensic science

Education is key!



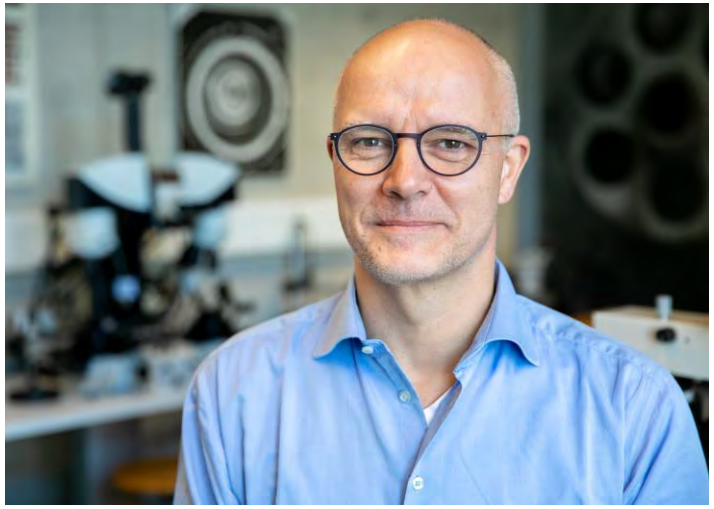
University curricula, on-going education, conferences, articles, books…

MOOC to promote critical thinking with regard to forensic science

Causes célèbres supplemented with interviews

Aim of the course : realise that uncertainty is an inevitable part of forensic science and probabilistic reasoning is essential to avoid misleading the court.

The MOOC team

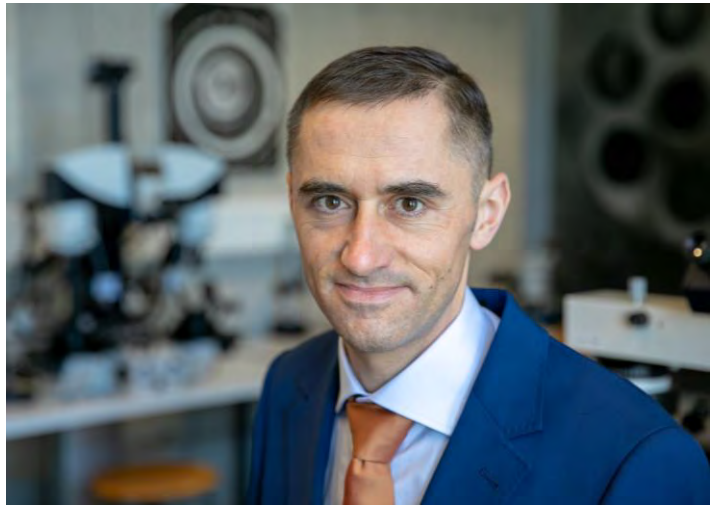


Franco Taroni

Tacha Hicks

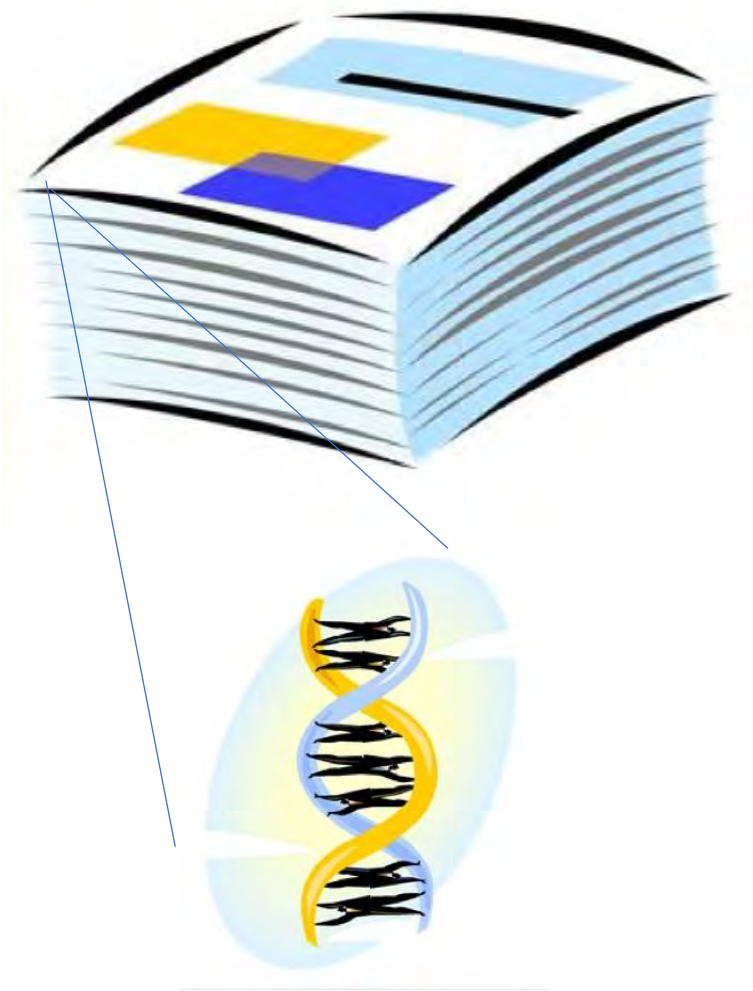
Christophe Champod

Alex Biedermann



Batochime: one week, one room

What is the DNA of a good forensic report?



Forensic science and evaluative reporting

Uncertainty in the criminal trial

Principles of forensic reporting

ENFSI guideline for evaluative reporting

Elementary: source is not activity!

DNA recovered on a suspect: Weller case

Gunshot residues on a suspect: George case

DNA recovered on a victim: Butler and Nealon cases

DNA is not the magic bullet -

DNA in the laboratory

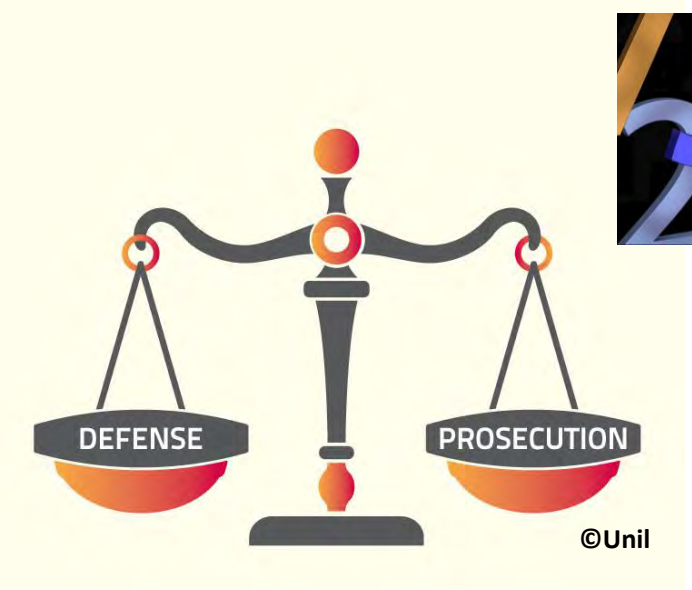
Small quantities of DNA: the Knox and Sollecito case

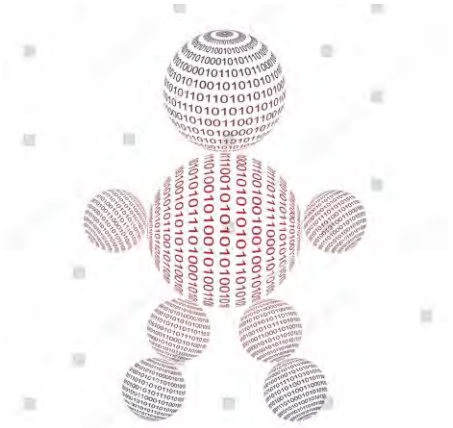
Transfer and pollution: the Jama case

Transfer and pollution: Anderson and Scott cases

Interviews

Trials by numbers ≠ numbers on trial





The defendant :Mr. Number

Beware of the transposed conditional
Adams and Dreyfus cases

Statistics in Court: Clark and Collins cases

The wonderland of certainty

Version date: 10.03.2017

Suggestion for an EDNAP LHP exercise

Compare results of LHP between technologies and laboratories

- Sanger sequencing
- Illumina/Ion Torrent MPS

Labs to use their amplification/sequencing protocols

Apply individual analysis tools and compare to custom software (NFI offered LDS tools)

Analyse data in Innsbruck

Select samples that display LHP and can be shared between laboratories

- e.g. Control DNA, GEDNAP, …

confirming participation
