Available online 5 June 2006

• Recommendations considered in detail by UK and German working groups
UK DNA working group recommendations

NATIONAL RECOMMENDATIONS OF THE TECHNICAL UK DNA WORKING GROUP ON MIXTURE INTERPRETATION FOR THE NDNAD AND FOR COURT GOING PURPOSES

Peter Gill1, Rosalind M. Brown2†, Martin Fairley3†, Lara Lee3†, Maureen Smyth4, Neil Simpson5, Brian Irwin6, Jim Dunlop7†, Matt Greenhalgh8, Kerry Way9, Emma J. Westacott9, Steven Jon Ferguson10†, Lisa Victoria Ford10†, Tim Clayton11, June Guiness12

(submitted to FSI:Genetics)
Recommendations of the German working group

Allgemeine Empfehlungen der Spurenkommission zur Bewertung von DNA-Mischspuren
[General recommendations of the (German) stain commission on the interpretation of DNA results from mixed stains]
P.M. Schneider, R. Fimmers, W. Keil, G. Molsberger, D. Patzelt, W. Pflug, T. Rothämel, H. Schmitter, H. Schneider, B. Brinkmann
Rechtsmedizin 2006, 16 : 401 – 404

• SWGDAM have now set up a working group led by John Butler
• Similar group to be considered in Australia

• Rapidly reaching global agreement on the way forward.
• Way forward is to convert ISFG recommendations into ‘local’ working guidelines.
ISFG (2006) Recommendations

• **Recommendation 1:** The likelihood ratio is the preferred approach to mixture interpretation. The RMNE (probability of exclusion) approach is restricted to DNA profiles where the profiles are unambiguous. If the DNA crime stain profile is low level and some minor alleles are the same size as stutters of major alleles, and/or if drop-out is possible, then the RMNE method may not be conservative.

ISFG (2006) Recommendations

• **Recommendation 2**: Even if the legal system does not implicitly appear to support the use of the likelihood ratio, it is recommended that the scientist is trained in the methodology and routinely uses it in case notes, advising the court in the preferred method before reporting the evidence in line with the court requirements. The scientific community has a responsibility to support improvement of standards of scientific reasoning in the court-room.

ISFG (2006) Recommendations

ISFG (2006) Recommendations

• **Recommendation 4**: If peak height or area information is used to eliminate various genotypes from the unrestricted combinatorial method, this can be carried out by following a sequence of guidelines based on Clayton *et al.* *(Forensic Sci. Int. 1998;91:55-70).*

Steps in the interpretation of mixtures

- **Step #1**: Identify the Presence of a Mixture
- **Step #2**: Designate Allele Peaks
- **Step #3**: Identify the Number of Potential Contributors
- **Step #4**: Estimate the Relative Ratio of the Individuals Contributing to the Mixture
- **Step #5**: Consider All Possible Genotype Combinations
- **Step #6**: Compare Reference Samples

ISFG (2006) Recommendations

• **Recommendation 5:** The probability of the evidence under $H_p$ is the province of the prosecution and the probability of the evidence under $H_d$ is the province of the defense. The prosecution and defense both seek to maximize their respective probabilities of the evidence profile. To do this both $H_p$ and $H_d$ require propositions. There is no reason why multiple pairs of propositions may not be evaluated (Appendix C).

ISFG (2006) Recommendations

• **Recommendation 6:** If the crime profile is a major/minor mixture, where minor alleles are the same size (height or area) as stutters of major alleles, then stutters and minor alleles are indistinguishable. Under these circumstances alleles in stutter positions that do not support $H_p$ should be included in the assessment.

• In general, stutter percentage is <15%

ISFG (2006) Recommendations

• **Recommendation 7**: If drop-out of an allele is required to explain the evidence under Hp: (S = ab; E = a), then the allele should be small enough (height/area) to justify this. Conversely, if a full crime stain profile is obtained where alleles are well above the background level, and the probability of drop-out approaches $Pr(D) \approx 0$, then Hp is not supported.

ISFG (2006) Recommendations

• **Recommendation 8**: If the alleles of certain loci in the DNA profile are at a level that is dominated by background noise, then a biostatistical interpretation for these alleles should not be attempted.

ISFG (2006) Recommendations

• **Recommendation 9**: In relation to low copy number, stochastic effects limit the usefulness of heterozygous balance and mixture proportion estimates. In addition, allelic drop-out and allelic drop-in (contamination) should be taken into consideration of any assessment.

Bringing the commission to a conclusion

• How to demonstrate a consensus?
Peer review process

ISFG DNA commission -> EDNAP -> ENFSI

National working groups
ENFSI Statement:

The general principles described by ISFG DNA commission recommendations on mixture interpretation are accepted by the ENFSI group.
