---

**Abstract.** Allele frequency data for the 15 STR systems, Amelogenine and 12 STRs from chromosome Y were determined in a population sample of healthy Amerindian Huaorani individuals. All loci met Hardy–Weinberg expectations and the high discrimination power of the combined system showed the forensic efficiency of these genetic markers. © 2006 Published by Elsevier B.V.

**Keywords:** Ecuador; STR; Forensic genetics; Amerindian Huaorani; Population genetics

## 1. Introduction

Huaorani population is the last nomad tribe of hunters–collectors from Ecuador. They speak Huao Tiriro and no similar language exists from the linguistic point of view. They live in small communities, some of them without any contact with western society, such as the Tagaeri and Taromenane. Traditionally, the basic social unit is the “nanicabo”, formed by 6 to 10 families living under the same roof. There are currently only 2000 individuals left in 716,000 ha, in dispersed communities in the Amazonia region. They are also called Aucas and Jíbaros. They shrink heads [1].

## 2. Material and methods

Population sample: Whole blood was obtained in EDTA Vacutainer tubes by venipuncture from healthy unrelated Amerindian Huaorani born and living in Ecuador.

h2	1	0.166667	14	14	16	13	30	23	10	15	13	14	12	13
h3	1	0.166667	14	14	16	13	30	23	10	15	13	14	12	11
h4	1	0.166667	13	15	15	13	28	23	10	14	13	14	11	10
h5	1	0.166667	14	14	16	12	30	23	10	15	12	14	12	12
h6	1	0.166667	14	14	16	13	30	23	10	15	13	14	12	12
Statistical parameters			N	k		Hd		$\square$		V				
Huaorani			6	6		1		$5.87 \pm 3.26$		$0.55 \pm 0.53$				

N, sample size; k, number of different haplotypes; Hd, haplotype diversity;  $\square$ , average pairwise differences between haplotypes; V, average repeat size variance. P min: allelic frequency minimum, MEC: Mean paternity exclusion chance; PIC: Polymorphism information content; Pm: Probability of match; PD: Discrimination power; Obs H: observed heterocigicity; Exp H: expected heterocigicity; FIS: inbreeding coefficient.

We collected all samples within a period of 6 months. N: 37 Huaorani. DNA extraction: DNA was extracted using Wizard Genomic DNA Purification Kit System<sup>©</sup>, and the quantity was estimated by UV absorbance. PCR: Amplification was performed in a Genius<sup>©</sup> model Techne Thermal Cycler. Typing: By ABI Prism 310. Fragment size and allele designation of different loci was determined by comparison with allelic ladders distributed into the PowerPlex 16 (Promega) kit. The recommendations of the DNA Commission of the International Society of Forensic Haemogenetics for analysis of STRs systems were followed. Quality control: GEP-ISFG Working Group (<http://www.gep-isfg.org>) proficiency testing. Data analysis: Evaluation of Hardy–Weinberg expectations was carried out using statistical parameters of forensic interest, as previously described [2,3].

### 3. Results and discussion

Table 1 shows Y chromosome haplotypes found, and Table 2 shows allelic frequencies of autosomic STRs. Cumulative power of discrimination (PD) of autosomic STRs was 0.9999 and cumulative mean exclusion chance (MEC) was 0.999625.
